## NOTE

Questions about accompanying documentation should be directed to Administrative and Customer Services Division, Publication Services Branch, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-4400

Questions about the CD-ROM should be directed to Marketing Services Office, Customer Services Center, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-INFO (4636)

Questions about the subject matter should be directed to Tim Marshall, Demographic Surveys Division, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 763-3806.

## ATTACHMENT 1

ABSTRACT<br>Current Population Survey, August 2010: Tobacco Use Supplement [machine-readable data file] / conducted by the Bureau of the Census for the U.S. Department of Commerce, National Telecommunications and Information Administration. Washington: Bureau of the Census [producer and distributor], 2012.

## Type of File:

Microdata; unit of observation is person.

## Universe Description:

For August 2010 the universe is person level, Month-in-Sample 1,2,3,5,6, and 7, for all persons aged 18 and above in the civilian noninstitutional population of the United States and completed the labor force interview. The probability sample selected to represent the universe consisted of 54,254 households.

Questionnaire Structure: The supplement is structured in Sections A through K (except I)

- Section A screened for prior cigarette usage and current usage status of everyday smoker, some days smoker or not at all.
- Section B questions were asked if they had smoked 100 cigarettes, is a selfrespondent and currently smoking everyday.
- Section C questions were asked if the person had smoked 100 cigarettes, is a selfrespondent and currently smoking some days.
- Section D asked self respondents questions about quit smoking attempts of the past 12 months, and if none, asks if ever quit.
- Section E asked self respondent current and some-day smokers about methods used during the most recent quit attempt within the past 12 months.
- Section F asked self respondent current and some-day smokers about Doctor and Dentist advice to stop smoking.
- Section G asked self respondent current and some-day smokers about the person's interest, likelihood, and confidence in quitting within the next 6 months.
- Section H questions were asked of self respondent former smokers (if the person had smoked 100 cigarettes, is a self-respondent and currently not smoking at all).
- Section J asked all respondents about use of other tobacco products.
- Section JJ asked about use of new smokeless dissolvable tobacco products.
- Section K asked about smoke-free policies at work and at home, attitudes towards smoking in different places, and what menthol smokers would do if menthol cigarettes were no longer sold.
- The Supplement Universe was :
(HRINTSTA = 1 AND
PRTAGE greater than or equal to 18 AND
HRMIS in $1,2,3,5,6,7$ ).

## Subject-Matter Description:

Data are provided on labor force activity for the week prior to the survey. Comprehensive data are available on the employment status, occupation, and industry of persons 15 years old and over. Also shown are personal characteristics such as age, sex, race, marital status, veteran status, household relationship, educational background, and Hispanic origin.

The Tobacco Use questions were asked of any person age 18 years or older in the household in August 2010.

## Geographic Coverage:

Geography data is provided to the State level and some sub-state levels for specific metropolitan identifiers (Attachment 11).

## Technical Description:

File Structure: Rectangular.
File Size:

## OVERVIEW

Current Population Survey

## Introduction

The Current Population Survey (CPS) is the source of the official government statistics on employment and unemployment. The CPS has been conducted monthly for over 50 years. Currently, we obtain interviews from about 56,000 households monthly, scientifically selected on the basis of area of residence to represent the nation as a whole, individual states, and other specified areas. Each household is interviewed once a month for four consecutive months one year, and again for the corresponding time period a year later. This technique enables us to obtain reliable month-to-month and year-to-year comparisons at a reasonable cost while minimizing the inconvenience to any one household.

Although the main purpose of the survey is to collect information on the employment situation, a very important secondary purpose is to collect information on demographic characteristics such as age, sex, race, marital status, educational attainment, family relationship, occupation, and industry. From time to time, additional questions are included on health, education, income, and previous work experience. The statistics resulting from these questions serve to update similar information collected once every 10 years through the decennial census, and are used by government policymakers and legislators as important indicators of our nation's economic situation and for planning and evaluating many government programs.

The CPS provides current estimates of the economic status and activities of the population of the United States. Because it is not possible to develop one or two overall figures (such as the number of unemployed) that would adequately describe the whole complex of labor market phenomena, the CPS is designed to provide a large amount of detailed and supplementary data. Such data are made available to meet a wide variety of needs on the part of users of labor market information.

Thus, the CPS is the only source of monthly estimates of total employment (both farm and nonfarm); nonfarm selfemployed persons, domestics, and unpaid helpers in nonfarm family enterprises; wage and salaried employees; and, finally, estimates of total unemployment.

It provides the only available distribution of workers by the number of hours worked (as distinguished from aggregate or average hours for an industry), permitting separate analyses of part-time workers, workers on overtime, etc. The survey is also the only comprehensive current source of information on the occupation of workers and the industries in which they work. Information is available from the survey not only for persons currently in the labor force but also for those who are outside the labor force. The characteristics of such persons whether married women with or without young children, disabled persons, students, older retired workers, etc., can be determined. Information on their current desire for work, their past work experience, and their intentions as to job seeking are also available.

For a more detailed discussion about the basic labor force data gathered on a monthly basis in the CPS survey, see "Explanatory Notes and Estimates of Error" in any recent issue of the Employment and Earnings, a Bureau of Labor Statistics periodical. This source is referred to on the next page.

## CPS Sample Design

The current CPS sample is selected based on 2000 census information. The first stage of the 2000 sample design created 2,025 geographic areas called primary sampling units (PSUs) in the entire United States. These PSUs were grouped into strata within each state. Some of these PSUs formed strata by themselves and were in sample with certainty, which is referred to as self-representing. Of the remaining nonself-representing PSUs, one PSU was selected from each stratum with the probability of selection proportional to the population of the PSU. A total of 824 PSUs were selected for sampling. The second stage of the sample design selected housing units within these PSUs.

Approximately 72,000 housing units are assigned for interview each month, of which about 60,000 are occupied and thus eligible for interview. The remainder are units found to be destroyed, vacant, converted to nonresidential use, containing persons whose usual place of residence is elsewhere, or ineligible for other reasons. Of the 60,000 occupied housing units, approximately 7 percent are not interviewed in a given month due to temporary absence (vacation, etc.), the residents are not found at home after repeated attempts, inability of persons contacted to respond, unavailability for other reasons, and refusals to cooperate. The interviewed households contain approximately 108,000 persons 15 years old and over, approximately 27,000 children $0-14$ years old, and about 450 Armed Forces members living with civilians either on or off base within these households. A more precise explanation regarding the CPS sample design is provided in "Explanatory Notes and Estimates of Error: Household Data - Sampling" in any issue of Employment and Earnings.

## Relationship of Current Population Survey Files to Publications

Each month, a significant amount of information about the labor force is published by the Bureau of Labor Statistics in the Employment and Earnings and Monthly Labor Review reports.

As mentioned previously, the CPS also serves as a vehicle for supplemental inquiries on subjects other than employment, which are periodically added to the questionnaire. From the basic and supplemental data, the Bureau of the Census issues three series of publications under the general title Current Population Reports:

```
P-20 Population Characteristics
P-23 Special Studies
P-60 Consumer Income
```

All Current Population Reports, including the other series for population estimates and projections and special censuses, may be obtained by subscription from the U.S. Government Printing Office at 202-783-3238. Subscriptions are available as follows: Population Characteristics, Special Studies, and Consumer Income series (P-20, P-23, P-60) combined, \$101 per year (sold as a package only); Population Estimates and Projections, (P-25), $\$ 27$ per year. Single issues may be ordered separately; ordering information and prices are provided in the Bureau of the Census Catalog and Guide, the Monthly Product Announcement (MPA), and in Census and You. Selected reports also may be accessed on the INTERNET at http://www.census.gov/prod/www/subject.html\#pop

## Geographic Limitations

The CPS sample was selected so that specific reliability criteria were met nationally, for each of the 50 States and for the District of Columbia. Since 1985, these reliability criteria have been maintained through periodic additions and deletions in the State samples. Estimates formed for geographic areas identified on the microdata file which are smaller than states are not as reliable.

## Weights

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns for the entire panel of respondents. The CPS estimation procedure involves weighting the data from each sample person. The base weight, which is the inverse of the probability of the person being in the sample, is a rough measure of the number of actual persons that the sample person represents. Almost all sample persons in the same state have the same base weight, but the weights across states are different. Selection probabilities may also differ for some sample areas due to field subsampling, which is done when areas selected for the sample contain many more households than expected. The base weights are then adjusted for noninterview, and the ratio estimation procedure is applied.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability of the respondent for other reasons. This noninterview adjustment is made separately for clusters of similar sample areas that are usually, but not necessarily, contained within a state. Similarity of sample areas is based on Core-Based Statistical Area (CBSA) status and size. Within each cluster, there is a further breakdown by residence. Each CBSA cluster is split by "principal city" and "balance of the CBSA." The proportion of occupied sample households not interviewed fluctuates around 8 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and state of residence. Because these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the survey estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio adjustment as follows:
a. First-stage ratio estimate. The purpose of the first-stage ratio adjustment is to reduce the contribution to variance that results from selecting a sample of PSUs rather than drawing sample households from every PSU in the nation. This adjustment is made to the CPS weights in two race cells: black and nonblack; it is applied only to PSUs that are nonself-representing and for those states that have a substantial number of black households. The procedure corrects for differences that existed in each state cell at the time of the 2000 census between 1) the race distribution of the population in sample PSUs and 2) the race distribution of all PSUs (both 1 and 2 exclude self-representing PSUs).
b. Second-stage ratio estimate. This procedure substantially reduces the variability of estimates and corrects, to some extent, for CPS undercoverage. The CPS sample weights are adjusted to ensure that sample-based estimates of population match independent population controls. Three sets of controls are used:
1) 51 state controls of the civilian noninstitutional population 16 years of age and older
2) national civilian noninstitutional population controls for 14 hispanic and 5 nonhispanic age-sex categories
3) national civilian noninstitutional population controls for 66 white, 42 black, and 10 "other" agesex categories

The independent population controls are prepared by projecting forward the resident population as enumerated on April 1, 2000. The projections are derived by updating demographic census data with information from a variety of other data sources that account for births, deaths, and net migration. Estimated numbers of resident Armed Forces personnel and institutionalized persons reduce the resident population to the civilian noninstitutional population. Estimates of net census undercount, determined from the Post Enumeration Survey, are added to the population projections. Prior to January 2003, the projections were based on earlier censuses, and prior to January 1994, there was no correction for census undercount. A summary of the current procedures used to make population projections is given in "Revisions in the Current Population Survey Effective January 2003" in the January 2003 issue of Employment and Earnings..

## Comparability of CPS From Microdata Files With Published Sources

Although total estimates of the population will equal published estimates, labor force estimates produced from a microdata file will not be directly comparable or identical with the published nonseasonally adjusted labor force data. The major reason for this is due to a final estimation procedure incorporated into the production of the published nonseasonally adjusted data. This procedure, known as a composite estimator, is a weighted average of two estimates for the current month for any particular item. The first estimate is the two-stage ratio estimate that includes all the estimation steps given above. The second estimate consists of the composite estimate for the preceding month to which has been added an estimate of the change from the preceding month, based on that part of the sample which is common to the two months (about 75 percent). This procedure is primarily used to increase the reliability of estimates of month-to-month change, although other reliability gains are also realized. As noted above, the composite estimation procedure does not affect estimates of the total population.

Another factor also inhibits microdata comparison with published labor force data. This is the seasonal adjustment that is applied to many published statistics. This adjustment is used to adjust for normal seasonal variations to help distinguish the underlying economic situation in month-to-month changes.

Shown below are data from January and July 1993 which demonstrate how estimates compiled using the final weights from the microdata file may differ from the published composited estimates, with and without seasonal adjustment. Note that the composite estimation procedure was not used for estimates published from January 1994 to May 1994. For a further description of both the composite estimator and seasonal adjustment, see "Explanatory Notes and Estimates of Error: Household Data - Estimating Methods (Composite Estimation Procedure)" and "Seasonal Adjustment" in any issue of Employment and Earnings.

## ATTACHMENT 3

OVERVIEW

## August 2010 Tobacco Use Supplement

## General

Census Bureau staff conducted a Tobacco Use Supplement (TUS) to the Current Population Survey (CPS) in conjunction with the August 2010 CPS. The National Cancer Institute (NCI) sponsored the supplement. The CPS is a monthly labor force survey conducted in approximately 59,000 interviewed households across the country. Attachment 8 contains a facsimile of the August 2010 TUS questions.

Census Bureau staff collected the previous series of NCI sponsored Tobacco Use Supplements to the CPS: in May 2006, August 2006 and January 2007; in February, June and November 2003; in June 2001, November 2001 and February 2002; in September 1998, January 1999, and May 1999; in September 1995, January 1996, and May 1996; and in September 1992, January 1993, and May 1993. We conducted an abbreviated TUS in January 2000 and May 2000 at the request of the NCI in order to assess the usage of cigars, snuff, pipes and chewing tobacco, as well as cigarettes by the U.S. population. Some of the respondents in January 2000 and May 2000 were also in the CPS panel in January 1999 or May 1999. Thus, a longitudinal cohort can be created from matching the full 1999 data on cigarette smoking to the limited cigarette smoking outcome data in 2000.

The 2003 Tobacco Use Special Cessation Supplement (TUSCS), had a special detailed set of cessation questions not on the standard TUS-CPS series Supplements. This 2003 Supplement was conducted in February, June and November 2003. In addition, the 2002 TUS and the 2003 TUSCS included a longitudinal cohort of 23,000 individuals (this subgroup was interviewed in Feb 2002 and again in Feb 2003). See http://riskfactor.cancer.gov/studies/tus-cps , http://riskfactor.cancer.gov/studies/tuscps/questionnaire.html , and Weighting the Overlap Sample report (PDF) at http://riskfactor.cancer.gov/studies/tus-cps/TUS-CPS_overlap.pdf for details on this cohort data. For matching variables see the 2003 Technical Documentation at http://www.census.gov/cps/methodology/techdocs.html, and the 2009 TUS-CPS Users’ Workshop presentation on handling the data at http://riskfactor.cancer.gov/studies/tuscps/workshops/2009/tusuw2009_gibson.pdf .

Prior to this August 2010 collection was a May 2010 collection and following it was a collection in January 2011. State data will be most reliable when using data from all three months of data collection, within a survey cycle. For this reason, we recommend using all three files when analyzing most state or sub-state level data. This is especially important when trying to replicate NCI future analysis of the 2010-2011data and the analysis of past survey
waves, as much of their analysis is based on a statistical average of all three months for any series of collection periods. Each file contains only TUS supplement data collected for the specific month (e.g., May 2010, August 2010 or January 2011); and its corresponding CPS data.

NCI took advantage of the CPS unique panel design by also sponsoring Census Bureau follow up data collection in May 2011 from respondents who were in the May 2010 TUS sample. This gave rise to a one year longitudinal cohort (or two years retrospectively). When the May 2011 file is released it will contain the matched set of records from May 2010 and May 2011and special overlap sample weights.

For the August 2010 Tobacco Use Supplement, THE CITATION IS: US Department of Commerce, Census Bureau 2012, National Cancer Institute sponsored Tobacco Use Supplement to the Current Population Survey August 2010. http://riskfactor.cancer.gov/studies/tus-cps/ and http://www.census.gov/cps/methodology/techdocs.html.

For more information about past, current, and future NCI TUS, and data reports and publications utilizing supplement data see the NCI website: http://riskfactor.cancer.gov/studies/tus-cps/.

## Data Collection

## TUS-CPS unique analysis opportunity- Linkages with other CPS or other non

 tobacco Supplements to the CPS. A unique feature of the CPS is its panel design, in whicheach household in the sample is surveyed for four consecutive months (panels \# 1-4) and then for four more consecutive months (panels \# 5-8) nine months later [see Attachment \# 2Overview of the Current Population Survey in this Technical Documentation, and U.S. Department of Commerce.2006. Current Population Survey. Design and Methodology Technical Paper 66. Washington, D.C.:U.S. Census Bureau http://www.census.gov/prod/2006pubs/tp-66.pdf . Due to this sampling strategy a subset of persons who were in sample for any given month of TUS-CPS fielding (e.g., May 2010, August 2010, or January 2011) can be linked with other CPS Basic and Supplement data from surveys conducted within about $+/-15$ months of a TUSCPS. This affords an opportunity to include other topics in analysis from the March Annual Social and Economic Supplement (ASEC), Internet Use, American Time Use (ATUS), Voting and Registration, Veterans, Food Security, and other CPS Supplements. The ATUS to the CPS would be especially useful for exploring how smokers identified in the TUS-CPS utilize their time as determinants of smoking cessation and tobacco use. Procedures for merging other CPS or CPS Supplement data to the 2010-11 TUS -CPS files can be located at http://riskfactor.cancer.gov/studies/tus-cps .

TUS-CPS data can also be linked to health outcomes data through the National Longitudinal Mortality Study (NLMS).
(http://surveillance.cancer.gov/disparities/nlms/ ). Health outcomes data include cancer incidence, cause- specific mortality, diagnostic, treatment, survival, and medical care costs from linkages with NCI SEER Registry, National Death Index, and Medicare claims data.

Respondents are included in the 2010-11 TUS-CPS main sample only once. Panels \#4 and \#8 for August 2010 which were interviewed as panels \#1 and \#5 in May 2010 were not given the main TUS in August -- eliminating any possibility of those individuals being in the sample twice with-in the 2010-11 main data files.

May 2010-May 2011 longitudinal cohort data (overlap sample). The subsequent May 2011 fielding data release will have the baseline and follow-up (longitudinal) data from the May 2010 and May 2011 matches.

The 2010-11 Tobacco Use Supplement Items. The Supplement consisted of Items PEA1 through SINTTP. All CPS household members age 18 years and older who had completed CPS Core items were eligible for these items in August 2010.

## Items for Both Proxy and Self-Respondents

Self-respondents were eligible for the entire supplement, whereas proxy respondents were only eligible for certain items. We only collected information from proxies on topics such as smoking status (Items PEA1 - PEA3) and the use of other tobacco products- pipes (asked separately about regular and water/hookah varieties), cigars (including large/regular, cigarillo, and little filtered varieties), and smokeless tobacco (including snuff, chewing tobacco, and snus varieties (Items PEJ1a@1-4 and PEJ2a@1-4).

## Items for Self-Respondents Only

In addition to the smoking and other tobacco use status questions, we asked selfrespondents various questions depending on their smoking/tobacco use status.

- We asked everyday, some days and former cigarette smokers and users of other non-cigarette tobacco products a set of detailed smoking history questions tailored to their status (Items PEB1 - PEB11, PEC1 - PEC11,, PEH1NUM - PEH11d, and PEJ2b - J7c2a).
- Also included were some new special questions or modified items first asked in the 2003 special cessation TUS series such as:

0 type of cigarettes smoked - menthol cigarettes including how long, switching, and reasons for use (Items PEB2-2a, B7c2-3, B11, PEC22a, PEC7d2-3, PEC11, PEH6Ci-5, PEH6Fa3b-c, PEH11a-d);
o measures of addiction - "time after awakening smoke first cigarette/use other tobacco product , and awakening during the night to smoke/use other tobacco (Items PEB5a-c, PEC5a-c, PEH8a-c, PEJ3a-h);
o more detailed questions on attempts to quit smoking (PEDa-D8R, PEH6d-6f2 ) or quit other forms of tobacco use (Items PEJ4PEJ7c2a);
o methods and treatments used to quit (PEE1a-E1e, PEH6d-6f2, PEJ4- J7c2a);
0 cost of cigarettes (including identifying purchases from Indian Reservations) (PEBA6a-PEB6e3SPC, PECA6a-PEC6e3SPC );
0 age initiating everyday cigarette smoking, and the state of residence at that time ( PEB7a-7bspc, PEC7a-7a3SP, PEH2-2bSPC ), and state of residence at birth (PEKStresh)..

- Questions first asked in the 2006-2007 TUS-CPS series regarding amount of cigarettes smoked about 12 months ago (Items PEB9 - B10b, PEC9-C10b, and PEH6A-H6C) and asking about purchase of individual cigarettes ("loosies"Items PEB6e1-6e3SPC and PEC6e1-6e3SPC).
- In addition, we asked current smokers questions, such as whether the medical and dental community had advised them to quit smoking (Items PEF1a PEF2c5), or if they were planning to quit in the near future (Items PEG1 PEG4). Similar questions (Items H61a-H62c5) on health professional advice to quit smoking were asked of former smokers. In addition to the general questions asked on the TUS, reports of types of advice given by the health professionals were obtained.
- An emerging tobacco product section that was initiated in 2003, asked about use of dissolvables (2010-2011 main survey), and E-cigarettes during the May 2011 follow-up survey.
- We also asked all self-respondents new or previously asked on past TUS series questions about:
o smoking policies in their work place (Items PEK1 - PEK3d),
$0 \quad$ smoking rules in the home (Item PEK4)
o their opinions about smoking in bars and cocktail lounges, and on outdoor children's playgrounds and outdoor children's sports fields (PEK6c, 6f)

$$
\begin{array}{ll}
\text { o } & \text { new opinion questions about smoking in casinos and cars } \\
\text { (Items PEK6g-6h2 and } \\
\text { o } & \begin{array}{l}
\text { what menthol smokers would most likely do if menthol } \\
\text { cigarettes were no longer sold. (PEK7) }
\end{array}
\end{array}
$$

Special Administrative Items. We also collected some special questions, such as who the proxy respondents were, the language in which the interview was conducted, the survey method (telephone vs. personal-visit interviews), Computer Assisted Telephone Interviewing (CATI) vs. Computer Assisted Personal Interviewing (CAPI), and the date of the interview.

## NOTE-

Beginning with the 2003 TUSCS-CPS both every day and some day current smokers who smoked at least 12 days in the last 30 days were asked about attempts to try to quit smoking lasting at least one day, including characteristics of the attempt(s). We asked those some-days smokers smoking less than 12 days during the past 30 days whether during the past 12 months, they had TRIED to QUIT smoking COMPLETELY (Da). Previous to 2001-02, only every day smokers were asked these questions on the TUS-CPS, and in 2001-

Another generally unique feature of the 2003 TUSCS-CPS, the 2006-07 TUSCPS, and the 2010-2011 TUS-CPS is asking former smokers questions on their previous level of addiction, use of treatment/methods to quit,, and advice from health professionals. This feature enables elegant comparisons between characteristics of former smokers- "successful quitters" and current smokers attempting to quit.

## Data Processing

The data processing involved editing the August 2010 Supplement data. This process is described on the next page.

## Edits, Allocations, and Recodes

Regular Edits. Data processing involved a consistency edit of all supplement items. The consistency edit ensured that the entries within an individual record followed the correct skip pattern.

Other Edits. We also edited the supplement data based on patterns of response, such as: (1) making check items consistent with entries; (2) making the various records of proxy/self consistent with each other; and (3) assigning a code " 88 " in the variable PES78 when we knew that the interview was done by a proxy, but we did not know by whom.

Recodes. We also created an interview status recode and a smoking status recode. The interview status recode is identified by the variable "INTRVIEW" where Code 1 is an interview and Code 2 is a non-interview. The smoking status recode is identified by the variable "SMOKSTAT" where Code 1 is a "never smoker," Code 2 is an "everyday smoker," Code 3 is a "some days smoker," Code 4 is a "former smoker," and Code -9 is "indeterminate (unknown) smoking status."

The values and universes and position locations for each variable are defined and identified in the supplement record layout (Attachment 7).

## Weighting

PWSSWGT for Labor Force Data. All adult records retain the "basic CPS weight," which controls for age, race, sex, and Hispanic origin estimates and for individual state 16+ estimates. Use the basic CPS final weight PWSSWGT for tallying the labor force items. For a description of this weight, see Attachment 2, "Overview of the Current Population Survey."

Special Supplement Weight. This file contains two special supplement weights: a supplement non-response adjustment weight and a supplement self-response adjustment weight. In addition to maintaining national demographic totals (for age, sex, race, and origin), these weights were designed to maintain each state's population total.

Supplement Non-Response and Self-Response Weights. Use the supplement non-response adjustment weight PWNRWGT for tallying the supplement items. When you are interested in self-response analysis (especially for those items requiring self-response only), use the supplement self-response adjustment weight PWSRWGT for tallying the supplement items.

Use of Weights When Using All Three Files. The best analysis of the TUS-CPS data, especially for states, will come from combining the data in all three collection periods (May 2010, August 2010, and January 2011). To use the weights when combining the three
files, divide each weight by three. The Source and Accuracy Statement found in Attachment _ contains a detailed description on how to use the TUS-CPS special parameters to make standard error estimates for August 2010 single file and the need for special replicate weight files for complex analysis such as regression. Replicate weight files are available from the NCI upon request (http://riskfactor.cancer.gov/studies/tus-cps/ ).

## August 2010 NCI sponsored TUS-CPS Files

CPS Labor Force Data. The August 2010 CPS file contains 153,444 records. The first 950 characters contain the labor force data for each record. Attachment 6 contains the CPS Basic Items Record Layout, which includes the variable name,
character size, location on the record, universe, and the possible values of each basic CPS variable included on the file.

The variable PRPERTYP determines the type of record as follows:

## PRPERTYP

1 = Child household member (0-14 years old)
2 = Adult civilian household member (15 + years old)
3 = Adult Armed Forces household member (15 + years old )
The variable HRINTSTA determines the interview status of the household.
HRINTSTA
1 = Interviewed
$2=$ Type A Non-interview (These records represent households that were eligible for CPS interview but were not interviewed because no one was home, household members were temporarily absent, etc.)

3 = Type B Non-interview (These records represent sample addresses determined to be ineligible for the CPS by virtue of a temporary situation, such as being vacant, nonresidential, etc. These
households could become eligible for a CPS interview.)

4 = Type C Non-interview (These records represent sample addresses determined to be ineligible for CPS by virtue of a permanent change such as demolished, condemned, etc. These addresses will not be visited again for CPS interviews.)

The Total Number of Records is Determined by Combining the Values of PRPERTYP (1-3) and HRINTSTA (2-4).

The values of PRPERTYP are:
Unweighted Counts
August 2010 All MIS August 2010 MIS 1,2,3,5,6,7

| 1 = Child | 27,292 | 20,487 |
| :--- | ---: | ---: |
| 2 = Adult, civilian, 15+ | 107,960 | 80,593 |
| 3 = Adult, armed forces | 467 | 349 |
|  | 135,719 | 101,429 |

The values of HRINTSTA are:
$1=$ Interview
$2=$ Type A Noninterview
$3=$ Type B Noninterview
$4=$ Type C Noninterview

August 2010 All MIS August 2010 MIS 1,2,3,5,6,7
1 = Interview
2 = Type A Noninterview
135,719
101,429
4,691
3639
3 = Type B Noninterview
12,446
9,349
568 554
Total
$\overline{153,444}$
114,971

For Supplement Non-Response and Supplement Self-Response Rates, see the Source \& Accuracy Statement, Attachment 16.

The total number of TUS-CPS Interviewed Adults 18+ (INTRVIEW=1) are:
August 2010 62,540
INTRVIEW=2 Represents those eligible for the TUS (those who completed the CPS items) but not interviewed

August 2010 13,630
Those ineligible for the TUS include: MIS 4 or 8; ( $\mathrm{N}=38,473$ ), Children, Prpertyp=1; ( $\mathrm{N}=$ 20,487), Armed Forces of MIS 1,2,3,5,6,7; ( $\mathrm{N}=349$ ), Incomplete CPS Labor Force of MIS $1,2,3,5,6,7$ (hrintsta ne 1 or pelig=3); $(\mathrm{N}=13,653)$, Adults $15-17$ years of age in MIS 1,2,3,5,6,7; $(\mathrm{N}=4,312)$.

## ATTACHMENT 4

GLOSSARY

## Current Population Survey

Age-Age classification is based on the age of the person at his/her last birthday. The adult universe (i.e., population of marriageable age) is comprised of persons 15 years and over for CPS labor force data.

Allocation Flag-Each edited item has a corresponding allocation flag indicating the nature of the edit. See the attachment on allocation flags for more information. The second character of the item name is always "X".

Armed Forces-Demographic information for Armed Forces members (enumerated in off-base housing or on-base with their families) is included on the CPS data files. No labor force information is collected of Armed Forces members in any month. In March, supplemental data on income are included for Armed Forces members. This is the only month that non-demographic information is included for Armed Forces members.

## Civilian Labor Force-(See Labor Force.)

Class of Worker-This refers to the broad classification of the person's employer. These broad classifications for current jobs are:

1) Federal government
2) State government
3) Local government
4) Private industry (including self-employed, incorporated)
5) Self-employed (not incorporated)
6) Working without pay

Domain-The domain for an item is a list or range of its possible values. Note that all unedited items have possible values of -1 (blank), -2 (don't know), and -3 (refused). Since all items have these possible values, they are not shown as valid entries for each item.

Duration of Unemployment-Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed are continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the present period of seeking work.

Earners, Number of-The file includes all persons 15 years old and over in the household with $\$ 1$ or more in wages and salaries, or $\$ 1$ or more of a loss in net income from farm or nonfarm self-employment during the preceding year.

Edited item-An edited item is allocated or imputed by the processing system. In most cases this means allocating a value where the unedited item contains a value of blank, "don't know", or "refused". The second character of the item name is always "E".

An edited version of an item exists only if that item is processed through the edits. If the edits never deal with a particular item, then that item only has an unedited version.

Since the instrument enforces skip patterns and consistency between many items, the edits are left mainly with the job of allocating missing values. Also, since an interviewer is allowed to "back up" in the interview, there may be "off-path" items filled in the unedited data. The edits also blank these off-path items if an edited version of the items exists.

## Education-(See Level of School Completed.)

## Employed-(See Labor Force.)

Family-A family is a group of two persons or more (one of whom is the householder) residing together and related by birth, marriage, or adoption. All such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family Household-A family household is a household maintained by a family (as defined above), and may include among the household members any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of Family).

Family Weight-This weight is used only for tallying family characteristics. In March, the weight on the family record is the March supplement weight of the householder or reference person.

Final Weight-Used in tabulating labor force items in all months, including March. The final weight is controlled to independent estimates for:

1) States
2) Origin, Sex, and Age
3) Age, Race, and Sex

This weight should not be used when tabulating March supplement data.
Full-Time Worker-Persons on full-time schedules include persons working 35 hours or more, persons who worked 1-34 hours for noneconomic reasons (e.g., illness) and usually work full-time, and persons "with a job but not at work" who usually work full-time.

Group Quarters-Group quarters are noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons unrelated to the person in charge.

Head Versus Householder-Beginning with the March 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used.

## Highest Grade of School Attended-(See Level of School Completed.)

Hispanic/Non-Hispanic Origin-A person's Hispanic/Non-Hispanic status in this file is determined on the basis of a question that simply asks "(Is/Are) (Name/you) Hispanic?"

Hours of Work-Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who is off on the Veterans Day holiday is reported as working 32 hours even though he is paid for the holiday.

For persons working in more than one job, the figures related to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Household-A household consists of all the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live with any other person in the structure, and when there is direct access from the outside or through a common hall. The count of households excludes persons living in group quarters, such as military barracks and institutions. Inmates of institutions (mental hospitals, rest homes, correctional institutions, etc.) are not included in the survey.

Household Weight-The household weight is used for tallying household characteristics. In March, the household weight is the March Supplement weight of the householder.

Householder-The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Householder With No Other Relatives in Household-A householder who has no relatives living in the household. This is the entry for a person living alone. Another example is the designated householder of an apartment shared by two or more unrelated individuals.

Householder With Other Relatives (Including Spouse) in Household-The person designated as householder if he/she has one or more relatives (including spouse) living in the household.

Industry, Occupation, and Class of Worker (I\&O)-Current Job (basic data)-For the employed, current job is the job held in the reference week (the week before the survey). Persons with two or more jobs are classified in the job at which they worked the most hours during the reference week. The unemployed are classified according to their latest full-time job lasting two or more weeks or by the job (either full-time or part-time). The I \& O questions are also asked of persons not in the labor force who are in the fourth and eighth months in sample and who have worked in the last five years.

Job Seekers-All unemployed persons who made specific efforts to find a job sometime during the 4-week period preceding the survey week.

Longitudinal Weight-Used for gross flows analysis. Only found on adult records matched from month to month.
PEMLR-(Major Labor Force Recode)-This classification is available for each civilian 15 years old and over according to his/her responses to the monthly (basic) labor force items.

Labor Force-Persons are classified as in the labor force if they are employed, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" includes all civilians classified as employed or unemployed. The file includes labor force data for civilians age 15 and over. However, the official definition of the civilian labor force is age 16 and over.

## 1. Employed

Employed persons comprise (1) all civilians who, during the survey week, do any work at all as paid employees or in their own business or profession, or on their own farm, or who work 15 hours or more as unpaid workers on a farm in a business operated by a member of the family; and (2) all those who have jobs but who are not working because of illness, bad weather, vacation, or labor-management dispute, or because they are taking time off for personal reasons, whether or not they are seeking other jobs. These persons would have a Monthly Labor Force Recode (MLR) of 1 or 2 respectively in characters 180-181 of the person record which designates "at work" and "with a job, but not at work." Each employed person is counted only once. Those persons who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week. If they worked an equal number of hours at more than one job, they are counted at the job they held the longest.

## 2. Unemployed

Unemployed persons are those civilians who, during the survey week, have no employment but are available for work, and (1) have engaged in any specific job seeking activity within the past 4 weeks such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) are waiting to be called back to a job from which they had been laid off; or (3) are waiting to report to a new wage or salary job within 30 days. These persons would have an MLR code of 3 or 4 in characters 180-181 of the person record. The unemployed includes job leavers, job losers, new job entrants, and job reentrants.

## a. Job Leavers

Persons who quit or otherwise terminate their employment voluntarily and immediately begin looking for work.

## b. Job Losers

Persons whose employment ends involuntarily, who immediately begin looking for work, and those persons who are already on layoff.

## c. New Job Entrants

Persons who never worked at a full-time job lasting two weeks or longer.

## d. Job Reentrants

Persons who previously worked at a full-time job lasting two weeks or longer but are out of the labor force prior to beginning to look for work.

Finally, it should be noted that the unemployment rate represents the number of persons unemployed as a percent of the civilian labor force 16 years old and over. This measure can also be computed for groups within the labor force classified by sex, age, marital status, race, etc. The job loser, job leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force 16 years old and over; the sum of the rates for the four groups thus equals the total unemployment rate.

## 3. Not in Labor Force

All civilians 15 years old and over who are not classified as employed or unemployed. These persons are further classified by major activity: retired, unable to work because of long-term physical or mental illness, and other. The "other" group includes, for the most part, students and persons keeping house. Persons who report doing unpaid work in a family farm or business for less than 15 hours are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are asked only in those households that are in the fourth and eighth months of the sample, i.e., the "outgoing" groups, those which had been in the sample for three previous months and would not be in for the subsequent month.

Persons classified as NILF have an MLR code of 5-7 in characters 180-181 of the person record.
Layoff-A person who is unemployed but expects to be called back to a specific job. If he/she expects to be called back within 30 days, it is considered a temporary layoff; otherwise, it is an indefinite layoff.

Level of School Completed/Degree Received-These data changed beginning with the January 1992 file. A new question, "What is the highest level of school ... has completed or the highest degree ... has received?" replaced the old "Highest grade attended" and "Year completed" questions. The new question provides more accurate data on the degree status of college students. Educational attainment applies only to progress in "regular" school. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to a school in the regular school system.

Looking for Work-A person who is trying to get work or trying to establish a business or profession.
Marital Status-The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of enumeration.

The category "married" is further divided into "married, civilian spouse present," "married, Armed Force spouse present," "married, spouse absent," "married, Armed Force spouse absent," and "separated." A person is classified as "married, spouse present" if the husband or wife is reported as a member of the household even though he or she may be temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as "separated" included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily estranged from their spouses because of marital discord.

For the purpose of this file, the group "other marital status" includes "widowed and divorced," "separated," and "other married, spouse absent."

Month-In-Sample-The term is defined as the number of times a unit is interviewed. Each unit is interviewed eight times during the life of the sample.

Never Worked-A person who has never held a full-time civilian job lasting two consecutive weeks or more.
Nonfamily Householder-A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Nonworker-A person who does not do any work in the calendar year preceding the survey.
Nonrelative of Householder With No Own Relatives in Household-A nonrelative of the householder who has no relative(s) of his own in the household. This category includes such nonrelatives as a foster child, a ward, a lodger, a servant, or a hired hand, who has no relatives of his own living with him in the household.

Nonrelative of Householder With Own Relatives (Including Spouse)in Household-Any household member who is not related to the householder but has relatives of his own in the household; for example, a lodger, his spouse, and their son.

Other Relative of Householder-Any relative of the householder other than his spouse or child; for example, father, mother, grandson, daughter-in-law, etc.

Out Variable-An instrument-created item that stores the results of another item.
Own Child-A child related by birth, marriage, or adoption to the family householder.
Part-Time, Economic Reasons-The item includes slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. (See also Full-Time Worker.)

Part-Time, Other Reasons-The item includes labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season.

Part-Time Work-Persons who work between 1 and 34 hours are designated as working "part-time" in the current job held during the reference week. For the March supplement, a person is classified as having worked part-time during the preceding calendar year if he worked less than 35 hours per week in a majority of the weeks in which he worked during the year. Conversely, he is classified as having worked full-time if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Part-Year Work-Part-year work is classified as less than 50 weeks' work.
Population Coverage-Population coverage includes the civilian population of the United States plus approximately one million members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces. This file excludes inmates of institutions. The labor force and work experience data are not collected for Armed Forces members.

Processing Recode-An item calculated by the processing system from a combination of other items in the database. The second character of the item name is always "R".

Race-The population is divided into six groups on the basis of race: White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or Other Pacific Islander, and Other races. The 2011 CPS uses the Census 2010 question on race that allows for more than one race reporting, but does not include the Census 2010 "Some Other Race" category.

Reentrants-Persons who previously worked at a full-time job lasting two weeks or longer, but who are out of the labor force prior to beginning to look for work.

Related Children-Related children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25 " and "own children of any age," include all children regardless of marital status. The totals include nevermarried children living away from home in college dormitories.

Related Subfamily-A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the householder or spouse. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the number of families.

School, Major Activity-A person who spent most of his time during the survey week attending any kind of public or private school, including trade or vocational schools in which students receive no compensation in money or kind.

Secondary Individual-A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily households and inmates of institutions) who is not related to any other person in the household or group quarters.

Self-Employed-Self-employed persons are those who work for profit or fees in their own business, profession or trade, or operate a farm.

Stretches of Unemployment-A continuous stretch is one that is not interrupted by the person getting a job or leaving the labor market to go to school, to keep house, etc. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the period of seeking work.

Unable to Work-A person is classified as unable to work because of long-term physical or mental illness, lasting six months or longer.

Unedited item-An item that is produced by the computer automated instrument, either collected during the interview or created by the instrument. The second character of the item name is always "U".

Unemployed-(See Labor Force.)
Unpaid Family Workers-Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by birth or marriage.

Unrelated Individuals-Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a nonfamily householder living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Unrelated Subfamily-An unrelated subfamily is a family that does not include among its members the householder and relatives of the householder. Members of unrelated subfamilies may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of families. However, the number of such unrelated subfamilies became so small ( 37,000 in 1967) that beginning with the data for 1968 (and beginning with the census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Veteran Status-If a person served at any time during the four most recent wartime periods, the codes for all periods of service are entered. A person can report up to 4 periods of service. The following codes are used:

0 Children under 15
1 September 2001 or later
2 August 1990 to August 2001
3 May 1975 to July 1990
4 Vietnam era (Aug 1964 to Apr 1975)
5 February 1955 to July 1964
6 Korean War (July 1950 to January 1955)
7 January 1947 to June 1950
8 World War II (December 1941 to December 1946)
9 November 1941 or earlier
Wage and Salary Workers-Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Also included are persons who are self-employed in an incorporated business.

Workers-(See Labor Force--Employed.)
Work Experience-Includes those persons who during the preceding calendar year did any work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Year-Round Full-Time Worker-A year-round full-time worker is one who usually worked 35 hours or more per week for 50 weeks or more during the preceding calendar year.

## ATTACHMENT 5

## HOW TO USE THE RECORD LAYOUT

Data users familiar with the CPS data files in prior years will see many similarities between the format of this file and those files released before January 1994. As in the past, there are numeric locations on the file which correspond to each variable. There is only one record layout which contains the variables for children, adults, and armed forces members. In prior years, each type of person had a separate record layout.

## Item Naming Conventions

$\not \subset \quad$ The first character of each variable name is one of the following:
H - Household item
G - Geography item

* P - Person item (includes adult items, child items, and armed forces items)
* There is no need to distinguish adult, child, and armed forces items in the variable names in the new system. The recode PRPERTYP (located in positions 161-162) tells you what category the person is in.
$\not \subset \quad$ The second character of each variable name is one of the following:
E - Edited item
U - Unedited item
X - Allocation flag (see Attachment 15 for more information)
W - Weight
R - Recode
$\not \subset \quad$ The remaining characters describe the variable.
$\not \subset \quad$ For multiple entry items, the file contains a separate variable for each possible response. Each item has the same descriptive name but a number is added as the last digit. For example, Question 22A allows separate entries for up to 6 job search methods. The item names are PELKM1 (this item is edited), PULKM2, (this item is unedited), PULKM3, etc. These items are located in positions 296-307 of the record layout.

[SKIP TO SECTION J]

\section*{SECTION J. OTHER TOBACCO USE-ALL RESPONDENTS}

J The next questions are about the use of tobacco other than in cigarettes. PRESS 1 TO CONTINUE

J1a (Have/Has) (you/name) EVER used any of the following EVEN ONE TIME?
(1) Yes
(2) No

J1a1 A regular cigar or cigarillo (in Spanish use "medium size cigar" instead of the word "cigarillo") OR a little filtered cigar? |__|

FR: Regular cigars ARE DIFFERENT FROM little filtered cigars. THEY CAN BE large cigars, OR SMALLER IN SIZE SUCH AS cigarillos (IN SPANISH USE "medium size cigars" INSTEAD OF THE WORD "cigarillos" HERE.) THEY ARE USUALLY SOLD INDIVIDUALLY OR IN PACKS OF 5 OR 8. SOME COMMON BRANDS ARE BLACK AND MILD'S, SWISHER SWEETS CIGARILLOS, AND PHILLIES BLUNTS, BUT THERE ARE OTHERS.

FR: Little filtered cigars ARE DIFFERENT FROM regular cigars and cigarillos (in Spanish use "medium size cigars" instead of word "cigarillos" here). THEY RESEMBLE CIGARETTES IN SIZE, AND ARE OFTEN SOLD IN PACKS OF 20. THEY ARE USUALLY BROWN IN COLOR AND HAVE A SPONGY FILTER LIKE A CIGARETTE. SOME COMMON BRANDS ARE PRIME TIME LITTLE FILTER CIGARS AND WINCHESTER LITTLE FILTER CIGARS, BUT THERE ARE OTHERS.

\section*{J1a2 A regular pipe filled with tobacco}

FR: IF ASKED, "pipe smoking" ONLY INCLUDES PIPE TOBACCO. IT DOES NOT INCLUDE SMOKING HASHISH, MARIJUANA, CRACK, OR OTHER SUBSTANCES IN A PIPE. DO NOT INCLUDE WATER PIPES/HOOKAHS \{who - kahs OR OTHER NAMES: SHISHA/NARGHILE/ARGILEH,OR HUBBLE-BUBBLE

J1a3 A water pipe or hookah \{pronounced: who-kah\} pipe filled with tobacco?
FR: IF ASKED, "water pipe or hookah \{who -kah\} pipe smoking" ONLY INCLUDES PIPE TOBACCO. IT DOES NOT INCLUDE SMOKING HASHISH, MARIJUANA, CRACK, OR OTHER SUBSTANCES IN A PIPE. A WATER PIPE OR HOOKAH \{who -kah\} PIPE IS ALSO REFERRED TO AS A SHISHA, NARGHILE, ARGILEH OR HUBBLE-BUBBLE.

The next question is about smokeless tobacco products which are used in the mouth --

J1a4 (Have/Has) (you/name) EVER used any of the following EVEN ONE TIME?
(1) Yes
(2) No

J1a4 SMOKELESS tobacco, such as moist snuff, dip, spit, chew tobacco or snus.
FR: Snuff or dip IS COMMONLY PLACED BETWEEN THE GUM AND LIP AND SOLD IN ROUND CANS IN --A LOOSE FORM OR A POUCH THAT LOOKS LIKE A SMALL TEA-BAG; COMMON BRANDS ARE SKOAL, COPENHAGEN AND GRIZZLEY BUT THERE ARE OTHERS.

Chewing or spit tobacco (ALSO TWIST, PLUG OR SCRAP) IS USUALLY PLACED IN THE SIDE OF THE MOUTH AND CHEWED AND OFTEN SOLD IN WALLETSIZED POUCHES; COMMON BRANDS ARE REDMAN, LEVI- GARRET, AND BEECH-NUT, BUT THERE ARE OTHERS.

Snus IS A SPITLESS TOBACCO PRODUCT THAT MAY BE SOLD IN A TIN OR SLIDEPAK IN A LOOSE FORM OR IN SMALL TEABAG-LIKE POUCHES; COMMON BRANDS ARE CAMEL SNUS, MARLBORO SNUS, AND SKOAL SNUS.

BOX 31

(1) Not allowed in ANY public areas
(2) Allowed in SOME public areas
(3) Allowed in ALL public areas

ENTER (4) IF NOT APPLICABLE

K3b Which of these best describes the smoking policy at your place of work for INDOOR WORK AREAS?

READ THE FIRST 3 ANSWER CATEGIES ONLY
(1) Not allowed in ANY work areas
(2) Allowed in SOME work areas
(3) Allowed in ALL work areas

ENTER (4) IF NOT APPLICABLE
\(\qquad\)
K3c During the PAST TWO WEEKS, has anyone smoked in the area in which you work?
(1)YES
(2) NO
\(\qquad\)
K3d Within the PAST 12 MONTHS, has your employer offered any stop smoking program or any other help to employees who want to quit smoking?
(1)YES
(2)NO
\(\qquad\)
K4 The final set of questions are about your home and other places.

K4 Which statement best describes the rules about smoking INSIDE YOUR HOME?
[READ IF NECESSARY]: "HOME" IS WHERE YOU LIVE. "RULES" INCLUDE ANY UNWRITTEN "RULES" AND PERTAIN TO ALL PEOPLE WHETHER OR NOT THEY RESIDE IN THE HOME OR ARE VISITORS, WORKMEN, ETC.
(1) No one is allowed to smoke anywhere INSIDE YOUR HOME
(2) Smoking is allowed in some places or at some times INSIDE YOUR HOME
(3) Smoking is permitted anywhere INSIDE YOUR HOME
\(\qquad\)

K6c In bars, cocktail lounges, and clubs, do you THINK that smoking SHOULD be allowed in all areas, allowed in some areas, or not allowed at all?
(1) Allowed in all areas
(2) Allowed in some areas
(3) Not allowed at all

K6f On outdoor children's playgrounds and outdoor children's sports fields, do you THINK that smoking SHOULD be allowed in all areas, allowed in some areas, or not allowed at all?
(1) Allowed in all areas
(2) Allowed in some areas
(3) Not allowed at all

K6g Inside casinos, do you THINK that smoking SHOULD be allowed in all areas, allowed in some areas, or not allowed at all?
(1) Allowed in all areas
(2) Allowed in some areas
(3) Not allowed at all
\(\qquad\)
K6h Inside a car, when there are other people present, do you THINK that smoking SHOULD...
(1) Always be allowed, GO TO K6h2
(2) Be allowed under some conditions, or GO TO K6h2
(3) Never be allowed? GO TO K7 IF B2=1 OR C2=1
(MENTHOL SMOKER); ELSE GO TO KStresh
DON'T KNOW OR REFUSED GO TO K6h2
K6h2 IF children are present inside the car, do you think that smoking SHOULD...
(1) Always be allowed,
(2) Be allowed under some conditions, or
(3) Never be allowed?

Ask K7 if B2=1 OR C2 = 1 (menthol smoker); ELSE GO TO KSTRESH.

K7 If menthol cigarettes were no longer sold, which of the following would you MOST LIKELY do:
(1) Switch to non-menthol cigarettes
(2) Switch to some other tobacco product; or
(3) Quit smoking and not use any other tobacco product

DO NOT READ CATEGORY \#4.
(4) NONE OF THE ABOVE

\section*{INDUSTRY CLASSIFICATION}

Industry Classification Codes for Detailed Industry (4 digit)
(Changes from 2000 Census classification noted)

These categories are aggregated into 52 detailed groups and 14 major groups (see page A-11). The codes in the right hand column are the 2002 NAICS equivalent. Changes from the Census 2000 classification are noted by asterisks (*).

These codes correspond to Items PEIO1ICD and PEIO2ICD, in positions 856-859 and 864-867 of the Basic CPS record layout in all months, except March. In the March, these codes correspond to PEIOIND, in positions 87-90 of the Person record.

\section*{ATTACHMENT 11}

\section*{Specific Metropolitan Identifiers \\ (Geographic Attachment for CPS Public Use File Documentation Beginning August 2005)}

List 1. FIPS Metropolitan Area (CBSA) Codes
List 2. FIPS Consolidated Statistical Area (CSA) Codes
List 3. Individual Principal Cities
List 4. FIPS County Codes

Unless otherwise noted, all definitions for geographic areas on these lists reflect the June 30, 2003 OMB definitions.

\section*{LIST 1: FIPS METROPOLITAN AREA (CBSA) CODES}

Unless otherwise noted, Metropolitan Areas are defined using June 30, 2003 OMB definitions. In the New England states, the New England City and Town Area definitions are used to define Metropolitan Areas rather than the county based definitions.

\section*{LIST 2: FIPS Consolidated Statistical Area (CSA) Codes}

The following CSA's (Combined Statistical Areas) contain 2 or more Metropolitan Statistical Areas that are in the CPS sample and are individually identified on the public use files. Micropolitan Statistical Areas are not specifically identified in the CPS and are not used to identify CSA's nor are parts of such areas coded as belonging to CSA's. The component CBSA's identified on the CPS Public Use Files are listed for each CSA. See the component CBSA listing for any notes concerning the areas in sample and identified on the files.
\begin{tabular}{|c|c|c|}

\hline & 78700 & Waterbury, CT NECTA \\
\hline
\end{tabular}

\footnotetext{
* These 2 NECTA's appear in both the New York City CSA (using the county based CBSA definitions) and the Bridgeport-New Haven-Stamford CNECTA (using the NECTA definitions). They are coded on the public use file in the GTCSA field as being in the Bridgeport-New Haven-Stamford CNECTA. If you want to add them to the New York City CSA, you'll need to add them in using the appropriate GTCBSA codes.
}

\section*{List 3: Individual Principal Cities}

Please Note: You must use the CBSA code in combination with the city code to uniquely identify principal cities. If a county name is provided, you must incorporate the county code into any algorithm used to tabulate a specific city's characteristics. The same applies to state codes for multi-state CBSA's.

\section*{Topcoding of Usual Hourly Earnings}

This variable will be topcoded based on an individual's usual hours worked variable, if the individual's edited usual weekly earnings variable is \(\$ 999\). The topcode is computed such that the product of usual hours times usual hourly wage does not exceed an annualized wage of \$150,000 ( \(\$ 2,885.00\) per week). Below is a list of the appropriate topcode.
\begin{tabular}{|c|c|c|c|c|c|}
\hline Hours & Topcode & Hours & Topcode & Hours & Topcode \\
\hline 1 & None & 34 & \$84.85 & 67 & \$43.06 \\
\hline 2 & None & 35 & \$82.43 & 68 & \$42.43 \\
\hline 3 & None & 36 & \$80.14 & 69 & \$41.81 \\
\hline 4 & None & 37 & \$77.97 & 70 & \$41.21 \\
\hline 5 & None & 38 & \$75.92 & 71 & \$40.63 \\
\hline 6 & None & 39 & \$73.97 & 72 & \$40.07 \\

\section*{ALLOCATION FLAGS}

\section*{Current Population Survey}

For every edited item, there is a corresponding allocation flag with the prefix "PX". The last six characters of the names are the same. For example, PXMLR is the allocation flag for PEMLR. All allocation flags have the following list of possible values.
```

00 VALUE - NO CHANGE
01 BLANK - NO CHANGE
02 DON'T KNOW - NO CHANGE
03 REFUSED - NO CHANGE
10 VALUE TO VALUE
11 BLANK TO VALUE
12 DON'T KNOW TO VALUE
13 REFUSED TO VALUE
20 VALUE TO LONGITUDINAL VALUE
21 BLANK TO LONGITUDINAL VALUE
22 DON'T KNOW TO LONGITUDINAL VALUE
23 REFUSED TO LONGITUDINAL VALUE
30 VALUE TO ALLOCATED VALUE LONG.
31 BLANK TO ALLOCATED VALUE LONG.
32 DON'T KNOW TO ALLOCATED VALUE LONG.
33 REFUSED TO ALLOCATED VALUE LONG.
40 VALUE TO ALLOCATED VALUE
41 BLANK TO ALLOCATED VALUE
DON'T KNOW TO ALLOCATED VALUE
43 REFUSED TO ALLOCATED VALUE
50 VALUE TO BLANK
52 DON'T KNOW TO BLANK
53 REFUSED TO BLANK

```

\section*{ATTACHMENT 16}

Source of the Data and Accuracy of the Estimates for the
August 2010 CPS Microdata File on Tobacco Use

\section*{SOURCE OF THE DATA}

The data in this microdata file are from the August 2010 Current Population Survey (CPS). The U.S. Census Bureau conducts the CPS every month, although this file has only August data. The August survey uses two sets of questions, the basic CPS and a set of supplemental questions. The CPS, sponsored jointly by the Census Bureau and the U.S. Bureau of Labor Statistics, is the country's primary source of labor force statistics for the entire population. The National Cancer Institute (NCI), an Institute within the National Institutes of Health (NIH) within the Department of Health and Human Services (DHHS), has sponsored the supplemental questions for the Tobacco Use Supplement (TUS) since 1992 including the most recent 2010-2011 series. The Centers for Disease Control and Prevention (CDC), also in the DHHS, has co-sponsored with NCI the survey waves 2001-2007.

Basic CPS. The monthly CPS collects primarily labor force data about the civilian noninstitutionalized population living in the United States. The institutionalized population, which is excluded from the population universe, is composed primarily of the population in correctional institutions and nursing homes ( 91 percent of the 4.1 million institutionalized people in Census 2000). Interviewers ask questions concerning labor force participation about each member 15 years old and over in sample households. Typically, the week containing the nineteenth of the month is the interview week. The week containing the twelfth is the reference week (i.e., the week about which the labor force questions are asked).

The CPS uses a multistage probability sample based on the results of the decennial census, with coverage in all 50 states and the District of Columbia. The sample is continually updated to account for new residential construction. When files from the most recent decennial census become available, the Census Bureau gradually introduces a new sample design for the CPS.

In April 2004, the Census Bureau began phasing out the 1990 sample \(^{1}\) and replacing it with the 2000 sample, creating a mixed sampling frame. Two simultaneous changes occurred during this phase-in period. First, primary sampling units (PSUs) \({ }^{2}\) selected for only the 2000 design gradually replaced those selected for the 1990 design. This involved 10 percent of the sample. Second, within PSUs selected for both the 1990 and 2000 designs, sample households from the 2000 design gradually replaced sample households from the 1990 design. This involved about 90 percent of the sample. The new sample design was completely implemented by July 2005.

\footnotetext{
\({ }^{1}\) For detailed information on the 2000 sample redesign, please see reference [1].
\({ }^{2}\) The PSUs correspond to substate areas (i.e., counties or groups of counties) that are geographically contiguous.
}

In the first stage of the sampling process, PSUs are selected for sample. The United States is divided into 2,025 PSUs. The PSUs were redefined for this design to correspond to the Office of Management and Budget definitions of Core-Based Statistical Area definitions and to improve efficiency in field operations. These PSUs are grouped into 824 strata. Within each stratum, a single PSU is chosen for the sample, with its probability of selection proportional to its population as of the most recent decennial census. This PSU represents the entire stratum from which it was selected. In the case of strata consisting of only one PSU, the PSU is chosen with certainty.

Approximately 72,000 housing units were selected for sample from the sampling frame in August. Based on eligibility criteria, 11 percent of these housing units were sent directly to computer-assisted telephone interviewing (CATI). The remaining units were assigned to interviewers for computer-assisted personal interviewing (CAPI). \({ }^{3}\) Of all housing units in sample, about 59,000 were determined to be eligible for interview. Interviewers obtained interviews at about 54,000 of these units. Noninterviews occur when the occupants are not found at home after repeated calls or are unavailable for some other reason.

August 2010 Supplement. In August 2010, in addition to the basic CPS questions, interviewers asked supplementary questions on tobacco use of the civilian noninstitutionalized population 18 years and older. The TUS is a large, nationally representative survey, which enables it to produce national, state, and some substate estimates, especially when 3 months of a TUS series are combined. The TUS collected information from about 63,000 respondents in August 2010. For some measures of use, approximately 25 percent of responses in August 2010 are proxy responses, with the rest of the data collected through self-response. On average, over the 19922010 survey period, approximately 69 percent ( 68 percent for self-only) of supplement respondents have been interviewed by telephone and 31 percent ( 32 percent for self-only) by personal interview. In August 2010, approximately 61 percent of all supplement respondents were interviewed by telephone and 39 percent by personal interview; the same percentages apply for self-only. See reference [4] for more information.

Basic CPS Estimation Procedure. This survey's estimation procedure adjusts weighted sample results to agree with independently derived population estimates of the civilian noninstitutionalized population of the United States and each state (including the District of Columbia). These population estimates, used as controls for the CPS, are prepared monthly to agree with the most current set of population estimates that are released as part of the Census Bureau's population estimates and projections program.

The population controls for the nation are distributed by demographic characteristics in two ways:
- Age, sex, and race (White alone, Black alone, and all other groups combined).
- Age, sex, and Hispanic origin.

\footnotetext{
3 For further information on CATI and CAPI and the eligibility criteria, please see reference [2].
}

The population controls for the states are distributed by race (Black alone and all other race groups combined), age ( \(0-15,16-44\), and 45 and over), and sex.

The independent estimates by age, sex, race, and Hispanic origin, and for states by selected age groups and broad race categories, are developed using the basic demographic accounting formula whereby the population from the latest decennial data is updated using data on the components of population change (births, deaths, and net international migration) with net internal migration as an additional component in the state population estimates.

The net international migration component of the population estimates includes:
- Net international migration of the foreign born;
- Net migration between the United States and Puerto Rico;
- Net migration of natives to and from the United States; and
- Net movement of the Armed Forces population to and from the United States.

Because the latest available information on these components lags the survey date, it is necessary to make short-term projections of these components to develop the estimate for the survey date.

Tobacco Use Supplement Estimation Procedure. In addition to the CPS estimation procedure, the TUS uses a supplement noninterview adjustment and a supplement self-response adjustment. The supplement noninterview adjustment accounts for occupied sample households that responded to and completed the CPS, but not the supplement questionnaire. The self-response adjustment accounts for the elimination of interviews that were completed by proxy.

NOTE: The CPS household weight (HWHHWGT) adjusts for household nonresponse. Additional calculations are needed to create a supplement household weight. There are two sets of supplement weights on this microdata file. The nonresponse weight (PWNRWGT) includes only the noninterview adjustment. The self-response weight (PWSRWGT) includes both the noninterview adjustment and the self-response adjustment.

\section*{ACCURACY OF THE ESTIMATES}

A sample survey estimate has two types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error. The nature of the sampling error is known given the survey design; the full extent of the nonsampling error is unknown.

Sampling Error. Since the CPS estimates come from a sample, they may differ from figures from an enumeration of the entire population using the same questionnaires, instructions, and enumerators. For a given estimator, the difference between an estimate based on a sample and the estimate that would result if the sample were to include the entire population is known as sampling error. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of the magnitude of sampling error. However, they may include some nonsampling error.

Nonsampling Error. For a given estimator, the difference between the estimate that would result if the sample were to include the entire population and the true population value being estimated is known as nonsampling error. There are several sources of nonsampling error that may occur during the development or execution of the survey. It can occur because of circumstances created by the interviewer, the respondent, the survey instrument, or the way the data are collected and processed. For example, errors could occur because:
- The interviewer records the wrong answer, the respondent provides incorrect information, the respondent estimates the requested information, or an unclear survey question is misunderstood by the respondent (measurement error).
- Some individuals who should have been included in the survey frame were missed (coverage error).
- Responses are not collected from all those in the sample or the respondent is unwilling to provide information (nonresponse error).
- Values are estimated imprecisely for missing data (imputation error).
- Forms may be lost, data may be incorrectly keyed, coded, or recoded, etc. (processing error).

To minimize these errors, the Census Bureau applies quality control procedures during all stages of the production process including the design of the survey, the wording of questions, the review of the work of interviewers and coders, and the statistical review of reports.

Two types of nonsampling error that can be examined to a limited extent are nonresponse and undercoverage.

Nonresponse. The effect of nonresponse cannot be measured directly, but one indication of its potential effect is the nonresponse rate. For the August 2010 basic CPS, the household-level nonresponse rate was 8.0 percent. The person-level nonresponse rates for the Tobacco Use supplement were 17.9 percent for the total (self and proxy responses) and 38.4 for self-response only.

Since the basic CPS nonresponse rate is a household-level rate and the Tobacco Use supplement nonresponse rate is a person-level rate, we cannot combine these rates to derive an overall nonresponse rate. Nonresponding households may have fewer persons than interviewed ones, so combining these rates may lead to an overestimate of the true overall nonresponse rate for persons for the Tobacco Use supplement. In order for an individual to be eligible for the supplement, the individual's basic CPS questionnaire must have been completed. The TUS response rate is calculated as the percentage of those who completed the TUS to those who were eligible to complete it.

Coverage. The concept of coverage in the survey sampling process is the extent to which the total population that could be selected for sample "covers" the survey's target population. Missed housing units and missed people within sample households create undercoverage in the CPS. Overall CPS undercoverage for August 2010 is estimated to be about 12 percent. CPS coverage varies with age, sex, and race. Generally, coverage is larger for females than for males
and larger for non-Blacks than for Blacks. This differential coverage is a general problem for most household-based surveys.

The CPS weighting procedure partially corrects for bias from undercoverage, but biases may still be present when people who are missed by the survey differ from those interviewed in ways other than age, race, sex, Hispanic origin, and state of residence. How this weighting procedure affects other variables in the survey is not precisely known. All of these considerations affect comparisons across different surveys or data sources.

A common measure of survey coverage is the coverage ratio, calculated as the estimated population before poststratification divided by the independent population control. Table 1 shows August 2010 CPS coverage ratios by age and sex for certain race and Hispanic groups. The CPS coverage ratios can exhibit some variability from month to month.

Notes: (1) The Residual race group includes cases indicating a single race other than White or Black, and cases indicating two or more races.
(2) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Therefore, caution should be used when comparing results from different sources.

Data users should be careful when comparing the data from this microdata file, which reflects Census 2000-based controls, with microdata files from March 1994 through December 2002, which reflect 1990 census-based controls. Ideally, the same population controls should be used when comparing any estimates. In reality, the use of the same population controls is not practical when comparing trend data over a period of 10 to 20 years. Thus, when it is necessary to combine or compare data based on different controls or different designs, data users should be aware that changes in weighting controls or weighting procedures can create small differences
between estimates. See the discussion following for information on comparing estimates derived from different controls or different sample designs.

Microdata files from previous years reflect the latest available census-based controls. Although the most recent change in population controls had relatively little impact on summary measures such as averages, medians, and percentage distributions, it did have a significant impact on levels. For example, use of Census 2000-based controls results in about a 1 percent increase from the 1990 census-based controls in the civilian noninstitutionalized population and in the number of families and households. Thus, estimates of levels for data collected in 2003 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain population subgroups than for the total population.

Note that certain microdata files from 2002, namely June, October, November, and the 2002 ASEC, contain both Census 2000-based estimates and 1990 census-based estimates and are subject to the comparability issues discussed previously. All other microdata files from 2002 reflect the 1990 census-based controls.

Users should also exercise caution because of changes caused by the phase-in of the Census 2000 files (see "Basic CPS"). During this time period, CPS data were collected from sample designs based on different censuses. Three features of the new CPS design have the potential of affecting published estimates: (1) the temporary disruption of the rotation pattern from August 2004 through June 2005 for a comparatively small portion of the sample, (2) the change in sample areas, and (3) the introduction of the new Core-Based Statistical Areas (formerly called metropolitan areas). Most of the known effect on estimates during and after the sample redesign will be the result of changing from 1990 to 2000 geographic definitions. Research has shown that the national-level estimates of the metropolitan and nonmetropolitan populations should not change appreciably because of the new sample design. However, users should still exercise caution when comparing metropolitan and nonmetropolitan estimates across years with a design change, especially at the state level.

Caution should also be used when comparing Hispanic estimates over time. No independent population control totals for people of Hispanic origin were used before 1985.

A Nonsampling Error Warning. Since the full extent of the nonsampling error is unknown, one should be particularly careful when interpreting results based on small differences between estimates. The Census Bureau recommends that data users incorporate information about nonsampling errors into their analyses, as nonsampling error could impact the conclusions drawn from the results. Caution should also be used when interpreting results based on a relatively small number of cases. Summary measures (such as medians and percentage distributions) probably do not reveal useful information when computed on a subpopulation smaller than 75,000.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to references [2] and [5].

Standard Errors and Their Use. The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range about a given estimate that has a specified probability of containing the average result of all possible samples. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples, but one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis is that the population parameters are different. An example of this would be comparing the percentage of men who were part-time workers to the percentage of women who were part-time workers.

Tests may be performed at various levels of significance. A significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. For example, to conclude that two characteristics are different at the 0.10 level of significance, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.645 times the standard error of the difference.

The Census Bureau uses 90-percent confidence intervals and 0.10 levels of significance to determine statistical validity. Consult standard statistical textbooks for alternative criteria.

Estimating Standard Errors. The Census Bureau uses replication methods to estimate the standard errors of CPS estimates. These methods primarily measure the magnitude of sampling error. However, they do measure some effects of nonsampling error as well. They do not measure systematic biases in the data associated with nonsampling error. Bias is the average over all possible samples of the differences between the sample estimates and the true value.

Generalized Variance Parameters. While it is possible to compute and present an estimate of the standard error based on the survey data for each estimate in a report, there are a number of reasons why this is not done. A presentation of the individual standard errors would be of limited use, since one could not possibly predict all of the combinations of results that may be of interest to data users. Additionally, data users have access to CPS microdata files, and it is impossible to compute in advance the standard error for every estimate one might obtain from those data sets. Moreover, variance estimates are based on sample data and have variances of their own. Therefore, some methods of stabilizing these estimates of variance, for example, by generalizing or averaging over time, may be used to improve their reliability.

Experience has shown that certain groups of estimates have similar relationships between their variances and expected values. Modeling or generalizing may provide more stable variance estimates by taking advantage of these similarities. The generalized variance function is a simple model that expresses the variance as a function of the expected value of the survey estimate. The parameters of the generalized variance function are estimated using direct replicate variances. These generalized variance parameters provide a relatively easy method to obtain approximate standard errors for numerous characteristics. In this source and accuracy statement, Table 3 provides the generalized variance parameters for labor force estimates, Tables 4 and 5 provide generalized variance parameters for TUS nonresponse data and TUS selfresponse data. Tables 6 and 7 provide factors and population controls to derive U.S. state and regional parameters.

These parameters are designed to estimate the standard error of the number of people with a certain characteristic, not the number of tobacco products. For example, use Formula (1) below to estimate the standard error of the number of people who have ever smoked, and use Formula (2) to estimate the standard error of the percentage of people reporting a smoke-free environment. To estimate the standard error of a number of tobacco products, such as the average number of cigarettes smoked per day, use Formula (9). This formula is based on the distribution of the number of people using different amounts of tobacco products.

NOTE: The generalized variance parameters given in this document cannot be used when estimating variances for complex analysis research such as linear regression. Variances must be estimated using replicate weights for those types of analyses from the TUS data. Replicates are copies of the original sample that are systematically re-weighted to simulate the drawing of a different sample according to the same rules as the original was chosen. The differing estimates derived from the different replicates are used to estimate the variances for the sample itself. The re-weighting is done by multiplying the baseweights of the replicates by replicate factors produced from a 160x160 orthogonal Hadamard matrix; once that is done, the replicates go through the same weighting process as the actual sample to produce the replicate weights. The CPS and its supplements currently use 160 replicates. A more detailed discussion can be found in reference [2], pp.14-1 through 14-3. Replicate weights can be obtained from NCI upon request.

The basic CPS questionnaire records the race and ethnicity of each respondent. With respect to race, a respondent can be White, Black, Asian, American Indian and Alaskan Native (AIAN), Native Hawaiian and Other Pacific Islander (NHOPI), or combinations of two or more of the preceding. A respondent's ethnicity can be Hispanic or non-Hispanic, regardless of race.

The generalized variance parameters to use in computing standard errors are dependent upon the race/ethnicity group of interest. The following table summarizes the relationship between the race/ethnicity group of interest and the generalized variance parameters to use in standard error calculations.

Table 2. Estimation Groups of Interest and Generalized Variance Parameters
\begin{tabular}{|l|c|}
\hline \multicolumn{1}{|c|}{ Race/ethnicity group of interest } & \begin{tabular}{c} 
Generalized variance parameters to \\
use in standard error calculations
\end{tabular} \\
\hline Total population & Total or White \\
\hline White alone, White AOIC, or White non-Hispanic population & Total or White \\
\hline Black alone, Black AOIC, or Black non-Hispanic population & Black \\
\hline Asian alone, Asian AOIC, or Asian non-Hispanic population & \multirow{3}{*}{ Asian, AIAN, NHOPI } \\
\hline AIAN alone, AIAN AOIC, or AIAN non-Hispanic population & \multirow{2}{*}{ Asian, AIAN, NHOPI } \\
\hline \begin{tabular}{l} 
NHOPI alone, NHOPI AOIC, or NHOPI non-Hispanic \\
population
\end{tabular} & Hispanic \\
\hline Populations from other race groups & Black \\
\hline Hispanic population & Asian, AIAN, NHOPI \\
\hline \begin{tabular}{l} 
Two or more races - employment/unemployment and \\
educational attainment characteristics
\end{tabular} & \\
\hline Two or more races - all other characteristics & \\
\hline
\end{tabular}

Notes: (1) AIAN is American Indian and Alaska Native and NHOPI is Native Hawaiian and Other Pacific Islander.
(2) AOIC is an abbreviation for alone or in combination. The AOIC population for a race group of interest includes people reporting only the race group of interest (alone) and people reporting multiple race categories including the race group of interest (in combination).
(3) Hispanics may be any race.
(4) Two or more races refers to the group of cases self-classified as having two or more races.

Standard Errors of Estimated Numbers. The approximate standard error, \(s_{x}\), of an estimated number from this microdata file can be obtained by using the formula:
\[
\begin{equation*}
s_{x}=\sqrt{a x^{2}+b x} \tag{1}
\end{equation*}
\]

Here \(x\) is the size of the estimate and \(a\) and \(b\) are the parameters in Table 3, 4, or 5 associated with the particular type of characteristic. When calculating standard errors from crosstabulations involving different characteristics, use the set of parameters for the characteristic that will give the largest standard error.

\section*{Illustration 1}

Suppose there were \(7,743,000\) unemployed men ages 18 and up in the civilian labor force in August 2010. Use the appropriate parameters from Table 3 and Formula (1) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 1 } \\
\hline Number of unemployed males in the civilian & \(7,743,000\) \\
\(\quad\) labor force \((x)\) & -0.000032 \\
a parameter \((a)\) & 2,971 \\
b parameter \((b)\) & 145,000 \\
Standard error & \(7,504,000\) to \(7,982,000\) \\
\hline 90-percent confidence interval &
\end{tabular}

The standard error is calculated as
\[
s_{x}=\sqrt{-0.000032 \times 7,743,000^{2}+2,971 \times 7,743,000}=145,000
\]

The 90-percent confidence interval is calculated as \(7,743,000 \pm 1.645 \times 145,000\).
A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the parameter from Table 3,4 , or 5 as indicated by the numerator.

The approximate standard error, \(s_{y, p}\), of an estimated percentage can be obtained by using the formula:
\[
\begin{equation*}
s_{y, p}=\sqrt{\frac{b}{y} p(100-p)} \tag{2}
\end{equation*}
\]

Here \(y\) is the total number of people, families, households, or unrelated individuals in the base or denominator of the percentage, \(p\) is the percentage \(100{ }^{*} x / y(0 \leq p \leq 100)\), and \(b\) is the parameter in Table 3, 4, or 5 associated with the characteristic in the numerator of the percentage.

\section*{Illustration 2}

Suppose there were \(79,769,000^{4}\) people aged 45 to 64 in August 2010, of which 14.5 percent were every-day smokers. Use the appropriate parameter from Table 4 and Formula (2) to get

\footnotetext{
\({ }^{4}\) Some respondents who gave an age in the 45-64 range did not respond to question PEA3 ("do you now smoke cigarettes every day, some days, or not at all?"). As a result, using the estimate \((80,364,000)\) from PRTAGE=45-64 as a base would result in the estimated percentage of 45-64 year olds who were every day smokers, some day smokers, and former smokers summing to less than 100 percent of 45-64 year olds. Accordingly, we have used the weights of the PRTAGE=45-64 respondents who also responded to PEA3 as the base in this estimate, even though sum of the weights of the PRTAGE=45-64 respondents is our actual estimate of the number of persons in the 45-64 age range.
}
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 2 } \\
\hline Percentage of people aged 45-64 who were & 14.5 \\
\(\quad\) everyday smokers \((p)\) & \(79,769,000\) \\
Base \((y)\) & 5,764 \\
b parameter \((b)\) & 0.30 \\
Standard error & 14.0 to 15.0 \\
\hline 90 -percent confidence interval &
\end{tabular}

The standard error is calculated as
\[
s_{y, p}=\sqrt{\frac{5,764}{79,769,000} \times 14.5 \times(100.0-14.5)}=0.30
\]

The 90-percent confidence interval for the estimated percentage of people aged 45 to 64 who are every-day smokers is calculated as \(14.5 \pm 1.645 \times 0.30\).

\section*{Illustration 3}

Of all adults (ages 18 and up) in August 2010, suppose the number of former smokers was \(38,689,000\) and the number of ever (current and former) smokers was \(73,395,000^{5}\). The percentage of former smokers out of ever smokers (known as the "quit ratio") would be 52.7 percent. Use the appropriate parameter from Table 4 and Formula (2) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 3 } \\
\hline Percentage of adult ever smokers who don't & 52.7 \\
\(\quad\) smoke anymore \((p)\) & \(73,395,000\) \\
Base \((y)\) & 5,764 \\
b parameter \((b)\) & 0.44 \\
Standard error & 52.0 to 53.4 \\
\hline 90 -percent confidence interval & \\
\hline
\end{tabular}

The standard error is calculated as
\[
s_{y, p}=\sqrt{\frac{5,764}{73,395,000} \times 52.7 \times(100-52.7)}=0.44
\]
and the 90 -percent confidence interval is calculated as \(52.7 \pm 1.645 \times 0.44\).

\footnotetext{
\({ }^{5}\) Some persons who responded in the affirmative to question PEA1 ("have you smoked at least 100 cigarettes in your entire life?") did not respond to question PEA3 ("do you now smoke cigarettes every day, some days, or not at all?"). As a result, using the estimate \((74,178,000)\) from PEA1 as a base would result in the estimated percentages of every day smokers, some day smokers, and former smokers summing to less than 100 percent of the persons who had ever smoked. Accordingly, we have used the weighted responses to PEA3 as the base in this estimate, even though the estimate from PEA1 is our actual estimate of the number of ever smokers.

An alternative to using PEA 3 is to use SMOKSTAT. SMOKSTAT \(=2-4\) represents "Ever" smokers. The base number for "Ever smokers" using SMOKSTAT is the same as the number obtained from using PEA3.
}

16-11

Standard Errors of Estimated Differences. The standard error of the difference between two sample estimates is approximately equal to
\[
\begin{equation*}
s_{x_{1}-x_{2}}=\sqrt{s_{x_{1}}{ }^{2}+s_{x_{2}}{ }^{2}} \tag{3}
\end{equation*}
\]
where \(s_{x 1}\) and \(s_{x 2}\) are the standard errors of the estimates, \(x_{1}\) and \(x_{2}\). The estimates can be numbers, percentages, ratios, etc. This will result in accurate estimates of the standard error of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

\section*{Illustration 4}

In August 2010, suppose that for self-respondents, of the \(4,178,000^{6}\) non-Hispanic Blacks 18 to 24 years of age, 5.3 percent were every-day smokers, and of the \(17,356,000\) non-Hispanic Whites 18 to 24 years of age, 17.3 percent were every-day smokers. Use the appropriate parameters from Table 5 and Formulas (2) and (3) to get
\begin{tabular}{|l|r|r|r|}
\hline \multicolumn{4}{|c|}{ Illustration 4 } \\
\hline & Black \(\left(x_{1}\right)\) & \begin{tabular}{c} 
Non-Hispanic \\
White \(\left(x_{2}\right)\)
\end{tabular} & Difference \\
\hline \begin{tabular}{l} 
Percentage of people aged 18-24 \\
who were every-day smokers \((p)\)
\end{tabular} & 5.3 & 17.3 & 12.0 \\
\begin{tabular}{l} 
Base \((y)\)
\end{tabular} & \(4,178,000\) & \(17,356,000\) & - \\
b parameter \((b)\) & 8,107 & 7,660 & - \\
\begin{tabular}{l} 
Standard error \\
90-percent confidence \\
interval
\end{tabular} & 0.99 & 0.79 & 1.27 \\
\hline
\end{tabular}

The standard error of the difference is calculated as
\[
s_{x_{1}-x_{2}}=\sqrt{0.99^{2}+0.79^{2}}=1.27
\]

The 90 -percent confidence interval around the difference is calculated as \(12.0 \pm 1.645 \times 1.27\). Since this interval does not include zero, we can conclude with 90 percent confidence that the

\footnotetext{
\({ }^{6}\) Some respondents who indicated that they were non-Hispanic Blacks between 18 and 24 years of age did not respond to question PEA3 ("do you now smoke cigarettes every day, some days, or not at all?"). As a result, using the estimate \((4,193,000)\) from PEHSPNON=2 AND PTDTRACE \(=2\) AND PRTAGE \(=18-24\) as a base would result in the estimated percentages of every day smokers, some day smokers, and former smokers among non-Hispanic Blacks between 18 and 24 years of age summing to less than 100 percent. Accordingly, we have used the weighted responses to PEHSPNON=2 AND PTDTRACE=2 AND PRTAGE=18-24 AND PEA3=1,2,3 as the base in this estimate, even though the estimate from PEHSPNON=2 AND PTDTRACE=2 AND PRTAGE=18-24 is our actual estimate of the number of ever smokers.
An analogous statement applies to non-Hispanic Whites between 18 and 24 years of age, with 17,438,000 instead of \(4,193,000\) and PTDTRACE \(=1\) instead of PTDTRACE=2.
}
percentage of Black every-day smokers between 18 and 24 years of age is significantly different than the percentage of non-Hispanic White every-day smokers between 18 and 24 years of age.

Standard Errors of Estimated Ratios. Certain estimates may be calculated as the ratio of two numbers. Compute the standard error of a ratio, \(x / y\), using
\[
\begin{equation*}
s_{x / y}=\frac{x}{y} \sqrt{\left(\frac{s_{x}}{x}\right)^{2}+\left(\frac{s_{y}}{y}\right)^{2}-2 r \frac{s_{x} s_{y}}{x y}} \tag{4}
\end{equation*}
\]

The standard error of the numerator, \(s_{x}\), and that of the denominator, \(s_{y}\), may be calculated using formulas described earlier. In Formula (4), \(r\) represents the correlation between the numerator and the denominator of the estimate.

For one type of ratio, the denominator is a count of families or households and the numerator is a count of people in those families or households with a certain characteristic. If there is at least one person with the characteristic in every family or household, use 0.7 as an estimate of \(r\). An example of this type is the average number of children per family with children.

For another type of ratio, the population estimated by the numerator \((x)\) is a subset of the population estimated by the denominator \((y)\). In that case,
\[
\begin{equation*}
\mathrm{r}=\frac{\mathrm{x} \cdot \mathrm{~s}_{\mathrm{y}}}{\mathrm{y} \cdot \mathrm{~s}_{\mathrm{x}}} \tag{5}
\end{equation*}
\]

For all other types of ratios, \(r\) is assumed to be zero. Examples are the average number of children per family and the family poverty rate. If \(r\) is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

NOTE: For estimates expressed as the ratio of \(x\) per \(100 y\) or \(x\) per \(1,000 y\), multiply Formula (4) by 100 or 1,000 , respectively, to obtain the standard error.

\section*{Illustration 5}

In August 2010, suppose the number of adults who were self-reported as every-day smokers was \(28,076,000^{7}\) and the number of adults who were self-reported as some-day smokers was \(6,895,000^{8}\). The ratio of every-day smokers to some-day smokers would be 4.1. Use Formulas (1) and (4) and the appropriate parameters from Table 5, since the data is from self-respondents, with \(r=0\) to get

\footnotetext{
\({ }^{7}\) Computed in the same manner as in Illustration 8a to preserve consistency of estimates throughout this Source and Accuracy Statement. See footnote 9 to Illustration 8a.
\({ }^{8}\) Computed in the same manner as in Illustration 8 b to preserve consistency of estimates throughout this Source and Accuracy Statement. See footnote 10 to Illustration 8 b .
}
\begin{tabular}{|l|r|r|r|}
\hline \multicolumn{4}{|c|}{ Illustration 5 } \\
\hline & Every-day \((x)\) & Some-day \((y)\) & \multicolumn{1}{|c|}{ Ratio } \\
\hline Number of smokers & \(28,076,000\) & \(6,895,000\) & 4.1 \\
a parameter \((a)\) & -0.000032 & -0.000032 & - \\
b parameter \((b)\) & 7,660 & 7,660 & - \\
Standard error & 436,000 & 226,000 & 0.15 \\
90-percent confidence & \(27,359,000\) to 28,793,000 & \(6,523,000\) to \(7,267,000\) & 3.9 to 4.3 \\
interval &
\end{tabular}

The standard error of the ratio is calculated as
\[
s_{x / y}=\frac{28,076,000}{6,895,000} \sqrt{\left(\frac{436,000}{28,076,000}\right)^{2}+\left(\frac{226,000}{6,895,000}\right)^{2}}=0.15
\]
and the 90 -percent confidence interval is calculated as \(4.1 \pm 1.645 \times 0.15\).
Accuracy of State Estimates. The redesign of the CPS following the 1980 census provided an opportunity to increase efficiency and accuracy of state data. All strata are now defined within state boundaries. The sample is allocated among the states to produce state and national estimates with the required accuracy while keeping total sample size to a minimum. Improved accuracy of state data was achieved with about the same sample size as in the 1970 design.

Since the CPS is designed to produce both state and national estimates, the proportion of the total population sampled and the sampling rates differ among the states. In general, the smaller the population of the state the larger the sampling proportion. For example, in Vermont approximately 1 in every 250 households is sampled each month. In New York the sample is about 1 in every 2,000 households. Nevertheless, the size of the sample in New York is four times larger than in Vermont because New York has a larger population.

Standard Errors of State Estimates. The standard error for a state may be obtained by determining new state-level \(a\) and \(b\) parameters and then using these adjusted parameters in the standard error formulas mentioned previously. To determine a new state-level \(b\) parameter ( \(b_{\text {state }}\) ), multiply the \(b\) parameter from Table 3,4 , or 5 by the state factor from Table 6 . To determine a new state-level \(a\) parameter \(\left(a_{\text {state }}\right)\), use the following:
(1) If the \(a\) parameter from Table 3, 4 , or 5 is positive, multiply the \(a\) parameter by the state factor from Table 6.
(2) If the \(a\) parameter in Table 3, 4, or 5 is negative, calculate the new state-level \(a\) parameter as follows:
\[
\begin{equation*}
a_{\text {state }}=\frac{-b_{\text {state }}}{\operatorname{POP}_{\text {state }}} \tag{6}
\end{equation*}
\]
where \(P O P_{\text {state }}\) is the state population found in Table 6.

\section*{Illustration 6}

Suppose there were 1,618,000 adults living in Florida in August 2010 who were every-day smokers. Use the appropriate parameters, factor, and population from Tables 4 and 6 and Formulas (1) and (6) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 6 } \\
\hline Number of every-day smokers in Florida \((x)\) & \(1,618,000\) \\
b parameter \((b)\) & 5,764 \\
Florida state factor & 1.10 \\
State population & \(18,303,359\) \\
State a parameter \(\left(a_{\text {state }}\right)\) & -0.000346 \\
State b parameter \(\left(b_{\text {state }}\right)\) & 6,340 \\
Standard error & 97,000 \\
\hline
\end{tabular}

Obtain the state-level \(b\) parameter by multiplying the \(b\) parameter, 5,764 , by the state factor, 1.10. This gives \(b_{\text {state }}=5,764 \times 1.10=6,340\). Obtain the needed state-level \(a\) parameter by
\[
a_{\text {state }}=\frac{-6,340}{18,303,359}=-0.000346
\]

The standard error of the estimate of the number of adults in Florida who were every-day smokers can then be found by using Formula (1) and the new state-level \(a\) and \(b\) parameters, -0.000346 and 6,340 , respectively. The standard error is given by
\[
s_{x}=\sqrt{\left(-0.000346 \times 1,618,000^{2}\right)+(6,340 \times 1,618,000)}=97,000
\]

Standard Errors of Regional Estimates. To compute standard errors for regional estimates, follow the steps for computing standard errors for state estimates found in "Standard Errors of State Estimates" using the regional factors and populations found in Table 7.

Standard Errors of Groups of States. The standard error calculation for a group of states is similar to the standard error calculation for a single state. First, calculate a new state group factor for the group of states. Then, determine new state group \(a\) and \(b\) parameters. Finally, use these adjusted parameters in the standard error formulas mentioned previously.

Use the following formula to determine a new state group factor:
\[
\begin{equation*}
\text { state group factor }=\frac{\sum_{i=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}} \times \text { factor }_{\mathrm{i}}}{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}}} \tag{7}
\end{equation*}
\]
where \(P O P_{i}\) and factor \({ }_{i}\) are the population and factor for state \(i\) from Table 6.

To obtain a new state group \(b\) parameter ( \(b_{\text {state }}\) group \()\), multiply the \(b\) parameter from Table 3 , 4 , or 5 by the state group factor obtained by Formula (7). To determine a new state group a parameter ( \(a_{\text {state group }}\) ), use the following:
(1) If the \(a\) parameter from Table 3, 4, or 5 is positive, multiply the \(a\) parameter by the state group factor determined by Formula (7).
(2) If the \(a\) parameter in Table 3, 4, or 5 is negative, calculate the new state group \(a\) parameter as follows:
\[
\begin{equation*}
\mathrm{a}_{\text {state group }}=\frac{-\mathrm{b}_{\text {state group }}}{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}}} \tag{8}
\end{equation*}
\]

Illustration 7
Suppose the state group factor for the state group Illinois-Indiana-Michigan was required. Use Formula (7) and the appropriate factors and populations from Table 6 to get
\[
\text { state group factor }=\frac{(12,789,305 \times 1.13)+(6,359,522 \times 1.11)+(9,809,395 \times 1.13)}{12,789,305+6,359,522+9,809,395}=1.13
\]

Standard Errors of Averages for Grouped Data. The formula used to estimate the standard error of an average for grouped data is
\[
\begin{equation*}
s_{\bar{x}}=\sqrt{\frac{b}{y}\left(S^{2}\right)} \tag{9}
\end{equation*}
\]

In this formula, \(y\) is the size of the base of the distribution and \(b\) is the parameter from Table 3, 4, or 5 . The variance, \(S^{2}\), is given by the following formula:
\[
\begin{equation*}
\mathrm{S}^{2}=\sum_{\mathrm{i}=1}^{\mathrm{c}} \mathrm{p}_{\mathrm{i}} \overline{\mathrm{x}}_{\mathrm{i}}^{2}-\overline{\mathrm{x}}^{2} \tag{10}
\end{equation*}
\]
where \(\bar{x}\), the average of the distribution, is estimated by
\[
\begin{equation*}
\overline{\mathrm{x}}=\sum_{\mathrm{i}=1}^{\mathrm{c}} \mathrm{p}_{\mathrm{i}} \overline{\mathrm{x}}_{\mathrm{i}} \tag{11}
\end{equation*}
\]
and
\[
\begin{aligned}
& c= \text { the number of groups; } i \text { indicates a specific group, thus taking on values } 1 \\
& \text { through } c \text {. }
\end{aligned}
\]
\(p_{i}=\) estimated proportion of people, families, households, or unrelated individuals whose values, for the characteristic ( \(x\)-values) being considered, fall in group \(i\).
\(\bar{x}_{i}=\left(L_{i}+U_{i}\right) / 2\) where \(L_{i}\) and \(U_{i}\) are the lower and upper interval boundaries, respectively, for group i. \(\bar{x}_{i}\) is assumed to be the most representative value for the characteristic for people, families, households, or unrelated individuals in group i. If group \(c\) is open-ended, i.e., no upper interval boundary exists, use a group approximate average value of
\[
\begin{equation*}
\overline{\mathrm{x}}_{\mathrm{c}}=\frac{3}{2} \mathrm{~L}_{\mathrm{c}} \tag{12}
\end{equation*}
\]

NOTES: 1) For continuous data, i.e., income, time, etc., the upper bound of the \(i\) th interval and lower bound of the next interval are essentially the same. 2) Estimates for number of cigarettes smoked 'per some day' (as in Illustration 8b) must first be converted into estimates for number of cigarettes smoked 'per day' by multiplying by the average number of days smoked in the last 30 days, and dividing by 30 for each group \(i\).

\section*{Illustration 8a}

Suppose there were \(28,076,000^{9}\) adult every-day smokers among self-respondents in August 2010, and the distribution of the average number of cigarettes consumed per day was
\begin{tabular}{c|c|c} 
Cigarettes per day & Percent of smokers & \(\bar{x}_{i}\) \\
\hline \(1-10\) & 41.8 & \((1+10) / 2=5.5\) \\
\(11-20\) & 47.4 & \((11+20) / 2=15.5\) \\
\(21-30\) & 6.6 & \((21+30) / 2=25.5\) \\
\(31+\) & 4.2 & \(3 / 2(31)=46.5\)
\end{tabular}

Using Formula (11),
\[
\bar{x}=(0.418 \times 5.5)+(0.474 \times 15.5)+(0.066 \times 25.5)+(0.042 \times 46.5)=13.28
\]
and Formula (10),
\[
S^{2}=\left(0.418 \times 5.5^{2}\right)+\left(0.474 \times 15.5^{2}\right)+\left(0.066 \times 25.5^{2}\right)+\left(0.042 \times 46.5^{2}\right)-13.28^{2}=83.90
\]

Because this data is from self-respondents, use the appropriate parameter from Table 5 and Formula (9) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 8a } \\
\hline Average amount of cigarettes smoked per day for & 13.28 \\
\(\quad\) every-day smokers \((\bar{x})\) & 83.90 \\
Variance \(\left(S^{2}\right)\) & \(28,076,000\) \\
Base \((y)\) & 7,660 \\
b parameter \((b)\) & 0.151 \\
Standard error & 13.03 to 13.53 \\
\hline 90-percent confidence interval & \\
\hline
\end{tabular}

\footnotetext{
\({ }^{9}\) Some persons who responded as every day smokers to question PEA3 ("Do you now smoke cigarettes every day, some days, or not at all?") did not respond to PTB1 ("On the average, about how many cigarettes do you now smoke each day?") with answers greater than zero. As a result, using the estimate \((28,749,000)\) from PEA3 as a base would result in the estimated percentages of every day smokers who smoke 1-10, 11-20, 21-30, and 31or more cigarettes per day summing to well under 100 percent. Accordingly, we have used the weighted self-responses of those who answered both PTB1 with answers greater than zero as the base in this estimate, even though the estimate from PEA3 is our actual estimate of the number of every day smokers.
}

The standard error is calculated as
\[
s_{\bar{\chi}}=\sqrt{\frac{7,660}{28,076,000}(83.90)}=0.151
\]
and the 90 -percent confidence interval is calculated as \(13.28 \pm 1.645 \times 0.151\).
A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

\section*{Illustration 8b}

Suppose there were \(6,895,000^{10}\) adult some-day smokers among self-respondents in August 2010, and the distribution of the average number of cigarettes consumed per some day and per every day was
\begin{tabular}{c|c|c|c|c}
\begin{tabular}{c} 
Cigarettes per \\
some day
\end{tabular} & \begin{tabular}{c} 
Percent of \\
smokers
\end{tabular} & \(\bar{x}_{i}\) & \begin{tabular}{c} 
Avg \# of days \\
smoked in the last \\
30 days \(\left(d_{i}\right)\)
\end{tabular} & \begin{tabular}{c} 
Cigarettes per day \\
\(\left(\bar{x}_{i} \times d_{i} / 30\right)\)
\end{tabular} \\
\hline 1 & 13.3 & \((1+1) / 2=1.0\) & 10.3 & \(1.0^{*} 10.3 / 30=0.34\) \\
2 & 24.1 & \((2+2) / 2=2.0\) & 1.9 & \(2.0^{*} 11.9 / 30=0.79\) \\
3 & 15.3 & \((3+3) / 2=3.0\) & 13.6 & \(3.0 * 13.6 / 30=1.36\) \\
4 & 9.8 & \((4+4) / 2=4.0\) & 14.5 & \(4.0 * 14.5 / 30=1.93\) \\
\(5+\) & 37.4 & \(3 / 2(5)=7.5\) & 16.0 & \(7.5 * 16.0 / 30=4.00\)
\end{tabular}

\footnotetext{
\({ }^{10}\) Some persons who responded as some-day smokers to question PEA3 ("Do you now smoke cigarettes every day, some days, or not at all?") did not respond to both PEC1 ("On how many of the past 30 days did you smoke cigarettes?") and PTC1a (On the average, on those days, how many cigarettes did you usually smoke each day?) with answers greater than zero. As a result, using the estimate \((7,545,000)\) from PEA3 as a base would result in the estimated percentages of smokers who smoke \(1,2,3,4\), and 5 or more cigarettes per some day summing to well under 100 percent. Accordingly, we have used the weighted self-responses of those who answered both PEC1 and PTC 1a with answers greater than zero as the base in this estimate, even though the estimate from PEA3 is our actual estimate of the number of some day smokers.
}

Using Formula (11),
\[
\bar{x}=(0.133 \times 0.34)+(0.241 \times 0.79)+(0.153 \times 1.36)+(0.098 \times 1.93)+(0.374 \times 4.00)=2.13
\]
and Formula (10),
\(S^{2}=\left(0.133 \times 0.34^{2}\right)+\left(0.241 \times 0.79^{2}\right)+\left(0.153 \times 1.36^{2}\right)+\left(0.098 \times 1.93^{2}\right)+\left(0.374 \times 4.00^{2}\right)-2.13^{2}=2.26\)
Because this data is from self-respondents, use the appropriate parameter from Table 5 and Formula (9) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 8b } \\
\hline Average amount of cigarettes smoked per day for & 2.13 \\
\(\quad\) some-day smokers \((\bar{x})\) & 2.26 \\
Variance \(\left(S^{2}\right)\) & \(6,895,000\) \\
Base \((y)\) & 7,660 \\
b parameter \((b)\) & 0.050 \\
Standard error & 2.05 to 2.21 \\
\hline 90 -percent confidence interval & \\
\hline
\end{tabular}

The standard error is calculated as
\[
s_{\bar{\chi}}=\sqrt{\frac{7,660}{6,895,000}(2.26)}=0.050
\]
and the 90 -percent confidence interval is calculated as \(2.13 \pm 1.645 \times 0.050\).
A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Aggregates. Aggregates, such as the total number of cigarettes consumed, are computed by multiplying the average number of cigarettes consumed per smoker, \(\bar{x}\), by the total number of smokers, \(y\), in the formula
\[
\begin{equation*}
\mathrm{T}=\overline{\mathrm{x}} \mathrm{y} \tag{13}
\end{equation*}
\]
where \(T\) is the aggregate to be computed.

Both \(\bar{x}\) and \(y\) have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula
\[
\begin{equation*}
s_{T}=\sqrt{\bar{x}^{2} s_{y}^{2}+y^{2} s_{\bar{x}}^{2}} \tag{14}
\end{equation*}
\]
where \(s_{\bar{x}}\) is computed using Formula (9) and \(s_{y}\) is computed using Formula (1). In the above formula, the correlation between \(\bar{x}\) and \(y\) is assumed to be zero. If it is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product.

\section*{Illustration 9}

Continuing with Illustration 8a, suppose that the estimate for the total number of every-day smokers was \(28,076,000^{11}\) adults and that they smoked an average of 13.28 cigarettes per day. They then would consume approximately \(372,849,000\) cigarettes per day. Use the appropriate parameters from Table 5, since the data is self-reported, \(s_{y}\) and \(s_{\bar{x}}\) from Illustrations 5 and 8 a , respectively, and Formula (14) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration 9 } \\
\hline Average amount of cigarettes smoked per day \((\bar{x})\) & 13.28 \\
Standard error \(\left(s_{\bar{x}}\right)\) & 0.151 \\
Number of every-day smokers \((y)\) & \(28,076,000\) \\
Standard error \(\left(s_{y}\right)\) & 436,000 \\
Number of cigarettes consumed \((T)\) & \(372,849,000\) \\
Standard error \(\left(s_{T}\right)\) & \(7,176,000\) \\
90-percent confidence interval & \(361,044,000\) to \(384,654,000\) \\
\hline
\end{tabular}

The aggregate \(T\) is calculated as
\[
T=13.28 \times 28,076,000=372,849,000
\]
and the standard error for \(T\) is calculated as
\[
s_{T}=\sqrt{\left(13.28^{2} \times 436,000^{2}\right)+\left(28,076,000^{2} \times 0.151^{2}\right)}=7,176,000
\]

The 90-percent confidence interval is calculated as \(372,849,000 \pm 1.645 \times 7,176,000\).
A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

\footnotetext{
\({ }^{11}\) See footnote 9 to Illustration 8a.
}

Standard Errors of Averages for Daily Amount Smoked by Current Smokers. The formula used to estimate the standard error of the average daily amount smoked by current smokers is
\[
\begin{equation*}
s_{\bar{x}}=\sqrt{\left[\frac{P\left(C_{1}-C_{2}\right)}{(E+P)^{2}}\right]^{2} s_{E}^{2}+\left[\frac{E\left(C_{1}-C_{2}\right)}{(E+P)^{2}}\right]^{2} s_{P}^{2}+\left(\frac{E}{E+P}\right)^{2} s_{C_{1}}^{2}+\left(\frac{P}{E+P}\right)^{2} s_{C_{2}}^{2}} \tag{15}
\end{equation*}
\]
where
\(E=\) the estimated population of every-day smokers.
\(s_{E}=\) the standard error of the estimated population of every-day smokers.
\(P=\) the estimated population of some-day smokers.
\(s_{P}=\) the standard error of the estimated population of some-day smokers.
\(C_{1}=\) the average amount an every-day smoker smokes per day.
\(s_{C_{1}}=\) the standard error of the average amount an every-day smoker smokes per day.
\(C_{2}=\) the average amount a some-day smoker smokes per day.
\(s_{C_{2}}=\) the standard error of the average amount a some-day smoker smokes per day.
Illustration 10
Continuing with Illustrations 8 and 9 , suppose there were \(28,076,000^{12}\) every-day smokers that smoked an average of 13.28 cigarettes per day. In addition, suppose that \(6,895,000^{13}\) some-day smokers smoked an average of 2.13 cigarettes per day. Then, the distribution of the average number of cigarettes consumed per day by all current smokers would be

\footnotetext{
\({ }^{12}\) See footnote 9 to Illustration 8 a .
\({ }^{13}\) See footnote 10 to Illustration 8 b.
}
\begin{tabular}{c|c} 
Cigarettes per day & Percent of smokers \\
\hline 0.34 & 2.6 \\
0.79 & 4.8 \\
1.36 & 3.0 \\
1.93 & 1.9 \\
4.00 & 7.4 \\
5.5 & 33.6 \\
15.5 & 38.0 \\
25.5 & 5.3 \\
46.5 & 3.4
\end{tabular}
where \(\bar{x}\), the average amount smoked by all current smokers, is found using Formula (11) as
\[
\begin{aligned}
\bar{x}= & (0.026 \times 0.34)+(0.048 \times 0.79)+(0.030 \times 1.36)+(0.019 \times 1.93)+(0.074 \times 4.00) \\
& +(0.336 \times 5.5)+(0.380 \times 15.5)+(0.053 \times 25.5)+(0.034 \times 46.5)=11.09
\end{aligned}
\]

Use the appropriate parameters from Table 5, since this is self-respondent data, \(s_{E}\) and \(s_{P}\) from Illustration 5 and \(s_{C_{1}}\) and \(s_{C_{2}}\) from Illustration 8, and Formula (15) to get
\begin{tabular}{|l|r|}
\hline \multicolumn{2}{|c|}{ Illustration \(\mathbf{1 0}\)} \\
\hline Average amount of cigarettes smoked per day \((\bar{x})\) & 11.09 \\
Estimated population of every-day smokers \((E)\) & \(28,076,000\) \\
Standard error \(\left(S_{E}\right)\) & 436,000 \\
Estimated population of some-day smokers \((P)\) & \(6,895,000\) \\
Standard error \(\left(S_{P}\right)\) & 226,000 \\
Average amount of cigarettes smoked per day by every-day smokers \(\left(C_{1}\right)\) & 13.28 \\
Standard error \(\left(S_{C_{1}}\right)\) & 0.151 \\
Average amount of cigarettes smoked per day by some-day smokers \(\left(C_{2}\right)\) & 2.13 \\
Standard error \(\left(S_{C_{2}}\right)\) & 0.050 \\
Standard error & 0.137 \\
90 -percent confidence interval & 10.86 to 11.32 \\
\hline
\end{tabular}

The standard error for \(\bar{x}\) is calculated as
\[
\begin{aligned}
s_{\bar{x}}= & {\left[\left(\frac{6,895,000(13.28-2.13)}{(28,076,000+6,895,000)^{2}}\right)^{2} \times 436,000^{2}+\left(\frac{28,076,000(13.28-2.13)}{(28,076,000+6,895,000)^{2}}\right)^{2} \times 226,000^{2}\right.} \\
& \left.+\left(\frac{28,076,000}{28,076,000+6,895,000}\right)^{2} \times 0.151^{2}+\left(\frac{6,895,000}{28,076,000+6,895,000}\right)^{2} \times 0.050^{2}\right]^{1 / 2} \\
& =0.137
\end{aligned}
\]

The 90 -percent confidence interval is calculated as \(11.09 \pm 1.645 \times 0.137\).
A conclusion that the average estimate derived from all possible sample lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Quarterly or Yearly Averages. For information on calculating standard errors for labor force data from the CPS which involve quarterly or yearly averages, please see the "Explanatory Notes and Estimates of Error: Household Data" section in Employment and Earnings, a monthly report published by the U.S. Bureau of Labor Statistics.

Technical Assistance. If you require assistance or additional information, please contact the Demographic Statistical Methods Division via e-mail at dsmd.source.and.accuracy@census.gov.

\section*{Table 3. Parameters for Computation of Standard Errors for Labor Force} Characteristics: August 2010
\begin{tabular}{|l|c|c|}
\hline Characteristic & a & b \\
\hline Total or White & & \\
Civilian labor force, employed & -0.000016 & 3,068 \\
Not in labor force & -0.000009 & 1,833 \\
Unemployed & -0.000016 & 3,096 \\
Civilian labor force, employed, not in labor force, and unemployed & & \\
Men & -0.000032 & 2,971 \\
Women & -0.000031 & 2,782 \\
Both sexes, 16 to 19 years & -0.000022 & 3,096 \\
Black & & \\
Civilian labor force, employed, not in labor force, and unemployed & & \\
Total & -0.000151 & 3,455 \\
Men & -0.000311 & 3,357 \\
Women & -0.000252 & 3,062 \\
Both sexes, 16 to 19 years & -0.001632 & 3,455 \\
Hispanic, may be of any race & & \\
Civilian labor force, employed, not in labor force, and unemployed & & \\
Total & -0.000141 & \\
Men & -0.000253 \\
Women & -0.000266 \\
Both sexes, 16 to 19 years & -0.001528 & 3,455 \\
Asian, American Indian and Alaska Native, Native Hawaiian and & 3,357 \\
Other Pacific Islander & 3,062 \\
Civilian labor force, employed, not in labor force, and unemployed & 3,455 \\
Total & -0.000346 \\
Men & -0.000659 & \\
Women & -0.004146 & 3,198 \\
Both sexes, 16 to 19 years & 3,198 \\
\hline
\end{tabular}

Notes: (1) These parameters are to be applied to basic CPS monthly labor force estimates.
(2) The Total or White, Black, and Asian, AIAN, NHOPI parameters are to be used for both alone and in combination race group estimates.
(3) For nonmetropolitan characteristics, multiply the \(a\) and \(b\) parameters by 1.5 . If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the \(a\) and \(b\) parameters are zero.
(4) For foreign-born and noncitizen characteristics for Total and White, the \(a\) and \(b\) parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born and noncitizen characteristics for Black, Hispanic, and Asian, AIAN, NHOPI parameters.
(5) For the groups self-classified as having two or more races, use the Asian, AIAN, NHOPI parameters for all employment characteristics.
\begin{tabular}{|c|c|c|c|c|c|c|c|c|}
\hline & \multicolumn{2}{|l|}{Total or White} & \multicolumn{2}{|l|}{Black} & \multicolumn{2}{|l|}{Hispanic} & \multicolumn{2}{|l|}{Asian, AIAN, NHOPI} \\
\hline Characteristic & a & b & a & b & a & b & a & b \\
\hline Tobacco Use: August 2010 & & & & & & & & \\
\hline Both sexes & -0.000024 & 5,764 & -0.000135 & 6,181 & -0.000156 & 5,285 & -0.000361 & 6,181 \\
\hline Male or female & -0.000048 & 5,764 & -0.000270 & 6,181 & -0.000312 & 5,285 & -0.000723 & 6,181 \\
\hline Two Combined Months: May and August 2010 & & & & & & & & \\
\hline Both sexes & -0.000005 & 2,470 & -0.000029 & 2,649 & -0.000034 & 2,265 & -0.000078 & 2,649 \\
\hline Male or female & -0.000010 & 2,470 & -0.000058 & 2,649 & \(-0.000067\) & 2,265 & -0.000155 & 2,649 \\
\hline
\end{tabular}

Notes: (1) These parameters are to be applied to the August 2010 Tobacco Use Supplement data, and to combined May/August 2010 Tobacco Use Supplement data.
(2) AIAN is American Indian and Alaska Native and NHOPI is Native Hawaiian and Other Pacific Islander.
(3) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.
(4) The Total or White, Black, and Asian, AIAN, NHOPI parameters are to be used for both alone and in combination race group estimates.
(5) For nonmetropolitan characteristics, multiply the \(a\) and \(b\) parameters by 1.5 . If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the \(a\) and \(b\) parameters are zero.
(6) For foreign-born and noncitizen characteristics for Total and White, the \(a\) and \(b\) parameters should be multiplied by 1.3 . No adjustment is necessary for foreign-born and noncitizen characteristics for Black, Asian, AIAN, NHOPI, and Hispanic parameters.
(7) For the group self-classified as having two or more races, use the Asian, AIAN, NHOPI parameters for all characteristics except employment, unemployment, and educational attainment, in which case use Black parameters.

Notes: (1) These parameters are to be applied to the August 2010 Tobacco Use Supplement data, and to combined May/August 2010 Tobacco Use Supplement data.
(2) AIAN is American Indian and Alaska Native and NHOPI is Native Hawaiian and Other Pacific Islander.
(3) Hispanics may be any race. For a more detailed discussion on the use of parameters for race and ethnicity, please see the "Generalized Variance Parameters" section.
(4) The Total or White, Black, and Asian, AIAN, NHOPI parameters are to be used for both alone and in combination race group estimates.
(5) For nonmetropolitan characteristics, multiply the \(a\) and \(b\) parameters by 1.5 . If the characteristic of interest is total state population, not subtotaled by race or ethnicity, the \(a\) and \(b\) parameters are zero.
(6) For foreign-born and noncitizen characteristics for Total and White, the \(a\) and \(b\) parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born and noncitizen characteristics for Black, Asian, AIAN, NHOPI, and Hispanic parameters.
(7) For the group self-classified as having two or more races, use the Asian, AIAN, NHOPI parameters for all characteristics except employment, unemployment, and educational attainment, in which case use Black parameters.

Table 6. Factors and Populations for State Standard Errors and Parameters: August 2010
\begin{tabular}{|c|c|c|c|}
\hline State & One month factor & Two combined months factor & August 2010 Population \\
\hline Alabama & 1.09 & 1.07 & 4,658,887 \\
\hline Alaska & 0.18 & 0.18 & 687,514 \\
\hline Arizona & 1.13 & 1.09 & 6,594,717 \\
\hline Arkansas & 0.70 & 0.69 & 2,860,372 \\
\hline California & 1.14 & 1.09 & 36,790,302 \\
\hline Colorado & 1.14 & 1.10 & 5,025,633 \\
\hline Connecticut & 0.91 & 0.87 & 3,475,346 \\
\hline Delaware & 0.23 & 0.22 & 878,502 \\
\hline District of Columbia & 0.18 & 0.17 & 600,385 \\
\hline Florida & 1.10 & 1.06 & 18,303,359 \\
\hline Georgia & 1.11 & 1.08 & 9,727,941 \\
\hline Hawaii & 0.31 & 0.29 & 1,258,218 \\
\hline Idaho & 0.35 & 0.35 & 1,538,575 \\
\hline Illinois & 1.13 & 1.09 & 12,789,305 \\
\hline Indiana & 1.11 & 1.09 & 6,359,522 \\
\hline Iowa & 0.79 & 0.78 & 2,981,122 \\
\hline Kansas & 0.74 & 0.73 & 2,783,406 \\
\hline Kentucky & 1.11 & 1.08 & 4,254,579 \\
\hline Louisiana & 1.09 & 1.06 & 4,438,103 \\
\hline Maine & 0.42 & 0.40 & 1,299,859 \\
\hline Maryland & 1.16 & 1.11 & 5,640,361 \\
\hline Massachusetts & 1.11 & 1.06 & 6,556,293 \\
\hline Michigan & 1.13 & 1.10 & 9,809,395 \\
\hline Minnesota & 1.11 & 1.08 & 5,235,521 \\
\hline Mississippi & 0.73 & 0.73 & 2,893,705 \\
\hline Missouri & 1.15 & 1.12 & 5,912,550 \\
\hline Montana & 0.25 & 0.25 & 965,360 \\
\hline Nebraska & 0.47 & 0.46 & 1,781,541 \\
\hline Nevada & 0.65 & 0.63 & 2,634,179 \\
\hline New Hampshire & 0.37 & 0.35 & 1,310,147 \\
\hline New Jersey & 1.14 & 1.09 & 8,642,282 \\
\hline New Mexico & 0.51 & 0.49 & 1,999,344 \\
\hline New York & 1.16 & 1.12 & 19,374,824 \\
\hline North Carolina & 1.13 & 1.11 & 9,293,529 \\
\hline North Dakota & 0.17 & 0.17 & 637,148 \\
\hline Ohio & 1.13 & 1.11 & 11,385,984 \\
\hline Oklahoma & 0.94 & 0.92 & 3,644,084 \\
\hline Oregon & 1.00 & 0.99 & 3,822,939 \\
\hline Pennsylvania & 1.13 & 1.09 & 12,439,049 \\
\hline Rhode Island & 0.30 & 0.28 & 1,036,758 \\
\hline South Carolina & 1.11 & 1.08 & 4,506,705 \\
\hline South Dakota & 0.18 & 0.17 & 802,019 \\
\hline Tennessee & 1.12 & 1.09 & 6,249,091 \\
\hline Texas & 1.14 & 1.12 & 24,786,008 \\
\hline Utah & 0.54 & 0.53 & 2,816,475 \\
\hline Vermont & 0.19 & 0.18 & 615,683 \\
\hline Virginia & 1.12 & 1.08 & 7,737,754 \\
\hline Washington & 1.15 & 1.14 & 6,653,798 \\
\hline West Virginia & 0.41 & 0.40 & 1,802,440 \\
\hline Wisconsin & 1.13 & 1.09 & 5,601,011 \\
\hline Wyoming & 0.15 & 0.14 & 546,735 \\
\hline
\end{tabular}

Notes: (1) The state population counts in this table are for the \(0+\) population for August 2010.
(2) For foreign-born and noncitizen characteristics for Total and White, the \(a\) and \(b\) parameters should be multiplied by 1.3 . No adjustment is necessary for foreign-born and noncitizen characteristics for Black, Asian, AIAN, NHOPI, and Hispanic parameters.
\begin{tabular}{|l|c|c|c|}
\hline \multicolumn{5}{|c|}{ Table 7. Factors and Populations for Regional Standard } \\
Errors and Parameters: August 2010
\end{tabular}\(|\)

Notes: (1) The regional population counts in this table are for the \(0+\) population for August 2010.
(2) For foreign-born and noncitizen characteristics for Total and White, the \(a\) and \(b\) parameters should be multiplied by 1.3 . No adjustment is necessary for foreign-born and noncitizen characteristics for Black, Asian, AIAN, NHOPI, and Hispanic parameters.
