## NOTE

Questions about accompanying documentation should be directed to Administrative and Customer Services Division, Electronic Products Development Branch, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 457-1326.

Questions about the CD-ROM should be directed to Marketing Services Office, Customer Services Center, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 457-4100.

Questions about the subject matter should be directed to Michelle Schwab, Demographic Surveys Division, Bureau of the Census, Washington, D.C. 20233. Phone: (301) 457-3806.

# ATTACHMENT 1 

ABSTRACT<br>Current Population Survey, September 1998: Tobacco Use Supplement [machine-readable data file] / conducted by the Bureau of the Census for the National Cancer Institute. -Washington: Bureau of the Census [producer and distributor], 2001.

## Type Of File

Microdata; unit of observation is individuals within housing units.

## Universe Description

The universe consists of all persons in the civilian noninstitutional population of the United States living in households. The probability sample selected to represent the universe consists of approximately 48,000 households.

## Subject-Matter Description

Data are provided on labor force activity for the week prior to the survey. Comprehensive data are available on the employment status, occupation, and industry of persons 15 years old and over. Also shown are personal characteristics such as age, sex, race, marital status, veteran status, household relationship, educational background, and Hispanic origin.

The file also contains information on cigarette smoking and other tobacco products that will identify current smokers, former smokers, and nonsmokers.

## Geographic Coverage

States, regions and divisions are identified in their entirety. Within confidentiality restrictions; indicators are provided for consolidated metropolitan statistical areas (CMSA), 173 selected metropolitan statistical areas (MSA), 69 selected primary metropolitan statistical areas (PMSA), 217 counties, and 41 central cities in multicentral city metropolitan statistical areas or primary metropolitan statistical areas. Also within confidentiality restrictions, indicators are provided for metropolitan/nonmetropolitan, central city/balance metropolitan, MSA/CMSA size and MSA/PMSA size.

## Technical Description

File Structure: Rectangular.
File Size: 135,549 logical records; 1,052 character logical record length.
File Sort Sequence: State rank by CMSA/MSA rank by household identification number by line number.

## Reference Materials

Current Population Survey, September 1998: Tobacco Use Supplement Technical Documentation. Documentation contains this abstract, questionnaire facsimiles, and record layouts of the file. One copy accompanies each file order. Additional copies are available from Marketing Services Office, Customer Services Center, Bureau of the Census, Washington, DC 20233.

Bureau of the Census. The Current Population Survey Design and Methodology (Technical Paper 40) (out of print). Describes in detail the sample design and survey procedures used as well as accuracy of estimates and sampling errors. Reference copies should be available from most public libraries or Federal Depository Libraries.

## File Availability

The file may be ordered from Marketing Services Office, Customer Services Center using the Customer Services order form on the following page. It is available on CD-ROM in ASCII format.

## U.S. Census Bureau

## Census Bureau Order Form

Use this form to order CD-ROM's, tape-to-CD-ROM, customer products, technical documentation, computer tapes and cartridges, diskettes, and publications sold by Customer Services.

Charge your order: It's easy! MasterCard - VISA
To fax your order: 888-249-7295
Phone orders and special handling: 301-457-4100
Please Type or Print. Prices include regular domestic postage and handling. International customers, please add $\mathbf{3 3 \%}$.

| Quantity | Product Code | Title/series | Price each | Total price |

## OVERVIEW

Current Population Survey

## Introduction

The Current Population Survey (CPS) is the source of the official government statistics on employment and unemployment. The CPS has been conducted monthly for over 50 years. Currently, we obtain interviews from about 48,000 households monthly, scientifically selected on the basis of area of residence to represent the nation as a whole, individual states, and other specified areas. Each household is interviewed once a month for four consecutive months one year, and again for the corresponding time period a year later. This technique enables us to obtain reliable month-to-month and year-to-year comparisons at a reasonable cost while minimizing the inconvenience to any one household.

Although the main purpose of the survey is to collect information on the employment situation, a very important secondary purpose is to collect information on demographic characteristics such as age, sex, race, marital status, educational attainment, family relationship, occupation, and industry. From time to time, additional questions are included on health, education, income, and previous work experience. The statistics resulting from these questions serve to update similar information collected once every 10 years through the decennial census, and are used by government policymakers and legislators as important indicators of our nation's economic situation and for planning and evaluating many government programs.

The CPS provides current estimates of the economic status and activities of the population of the United States. Because it is not possible to develop one or two overall figures (such as the number of unemployed) that would adequately describe the whole complex of labor market phenomena, the CPS is designed to provide a large amount of detailed and supplementary data. Such data are made available to meet a wide variety of needs on the part of users of labor market information.

Thus, the CPS is the only source of monthly estimates of total employment (both farm and nonfarm); nonfarm selfemployed persons, domestics, and unpaid helpers in nonfarm family enterprises; wage and salaried employees; and, finally, estimates of total unemployment.

It provides the only available distribution of workers by the number of hours worked (as distinguished from aggregate or average hours for an industry), permitting separate analyses of part-time workers, workers on overtime, etc. The survey is also the only comprehensive current source of information on the occupation of workers and the industries in which they work. Information is available from the survey not only for persons currently in the labor force but also for those who are outside the labor force. The characteristics of such persons whether married women with or without young children, disabled persons, students, older retired workers, etc., can be determined. Information on their current desire for work, their past work experience, and their intentions as to job seeking are also available.

For a more detailed discussion about the basic labor force data gathered on a monthly basis in the CPS survey, see "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of Employment and Earnings published by the Bureau of Labor Statistics.

## CPS Sample Design

The current CPS sample is selected based on 1990 census information. The first stage of the 1990 sample design created 2,007 geographic areas called primary sampling units (PSUs) in the entire United States. These PSUs were grouped into strata within each state. Some of these PSUs formed strata by themselves and were in sample with certainty, which is referred to as self-representing. Of the remaining nonself-representing PSUs, one PSU was selected from each stratum with the probability of selection proportional to the population of the PSU. A total of 754 PSUs were selected for sample containing 2,121 counties, minor civil divisions, and independent cities. The second stage of the sample design selected housing units within these PSUs.

Approximately 60,000 housing units are assigned for interview each month, of which about 50,500 are occupied and thus eligible for interview. The remainder are units found to be destroyed, vacant, converted to nonresidential use, containing persons whose usual place of residence is elsewhere, or ineligible for other reasons. Of the 50,500 occupied housing units, approximately 5 percent are not interviewed in a given month due to temporary absence (vacation, etc.), the residents are not found at home after repeated attempts, inability of persons contacted to respond, unavailability for other reasons, and refusals to cooperate. The interviewed households contain approximately 94,000 persons 15 years old and over, approximately 28,000 children $0-14$ years old, and about 450 Armed Forces members living with civilians either on or off base within these households. A more precise explanation regarding the CPS sample design is provided in "Explanatory Notes and Estimates of Error: Household Data - Sampling" in any issue of Employment and Earnings.

## Relationship of Current Population Survey Files to Publications

Each month, a significant amount of information about the labor force is published by the Bureau of Labor Statistics in the Employment and Earnings and Monthly Labor Review reports.

As mentioned previously, the CPS also serves as a vehicle for supplemental inquiries on subjects other than employment, which are periodically added to the questionnaire. From the basic and supplemental data, the Bureau of the Census issues three series of publications under the general title Current Population Reports:

P-20 Population Characteristics
P-23 Special Studies
P-60 Consumer Income
All Current Population Reports, including the other series for population estimates and projections and special censuses, may be obtained by subscription from the U.S. Government Printing Office at 202-783-3238. Subscriptions are available as follows: Population Characteristics, Special Studies, and Consumer Income series (P-20, P-23, P-60) combined, $\$ 101$ per year (sold as a package only); Population Estimates and Projections, (P-25), $\$ 27$ per year. Single issues may be ordered separately; ordering information and prices are provided in the Bureau of the Census Catalog and Guide, the Monthly Product Announcement (MPA), and in Census and You. Selected reports also may be accessed on the INTERNET at http://www.census.gov/prod/www/subject.html\#pop

## Geographic Limitations

The CPS sample was selected so that specific reliability criteria were met nationally, for each of the 50 States and for the District of Columbia. Since 1985, these reliability criteria have been maintained through periodic additions and deletions in the State samples. Estimates formed for geographic areas identified on the microdata file which are smaller than states are not as reliable.

## Weights

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns for the entire panel of respondents. The CPS estimation procedure involves weighting the data from each sample person. The base weight, which is the inverse of the probability of the person being in the sample, is a rough measure of the number of actual persons that the sample person represents. Almost all sample persons in the same state have the same base weight, but the weights across states are different. Selection probabilities may also differ for some sample areas due to field subsampling, which is done when areas selected for the sample contain many more households than expected. The base weights are then adjusted for noninterview, and the ratio estimation procedure is applied.

1. Noninterview adjustment. The weights for all interviewed households are adjusted to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, or unavailability of the respondent for other reasons. This noninterview adjustment is made separately for clusters of similar sample areas that are usually, but not necessarily, contained within a state. Similarity of sample areas is based on Metropolitan Statistical Area (MSA) status and size. Within each cluster, there is a further breakdown by residence. Each MSA cluster is split by "central city" and "balance of the MSA". Each non-MSA cluster is split by "urban" and "rural" residence categories. The proportion of occupied sample households not interviewed fluctuates around 5 percent depending on weather, vacations, etc.
2. Ratio estimates. The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and state of residence. Because these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the survey estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio adjustment as follows:
a. First-stage ratio estimate. The purpose of the first-stage ratio adjustment is to reduce the contribution to variance that results from selecting a sample of PSUs rather than drawing sample households from every PSU in the nation. This adjustment is made to the CPS weights in two race cells: black and nonblack; it is applied only to PSUs that are nonself-representing and for those states that have a substantial number of black households. The procedure corrects for differences that existed in each state cell at the time of the 1990 census between 1) the race distribution of the population in sample PSUs and 2) the race distribution of all PSUs (both 1 and 2 exclude self-representing PSUs).
b. Second-stage ratio estimate. This procedure substantially reduces the variability of estimates and corrects, to some extent, for CPS undercoverage. The CPS sample weights are adjusted to ensure that sample-based estimates of population match independent population controls. Three sets of controls are used:
1) 51 state controls of the civilian noninstitutional population 16 years of age and older
2) national civilian noninstitutional population controls for 14 hispanic and 5 nonhispanic age-sex categories
3) national civilian noninstitutional population controls for 66 white, 42 black, and 10 "other" agesex categories

The independent population controls are prepared by projecting forward the resident population as enumerated on April 1, 1990. The projections are derived by updating demographic census data with information from a variety of other data sources that account for births, deaths, and net migration. Estimated numbers of resident Armed Forces personnel and institutionalized persons reduce the resident population to the civilian noninstitutional population. Estimates of net census undercount, determined from the Post Enumeration Survey, are added to the population projections. Prior to January 1994, the projections were based on earlier censuses, and there was no correction for census undercount. A summary of the current procedures used to make population projections is given in "Revisions in the Current Population Survey Effective January 1994" in the February 1994 issue of Employment and Earnings.

## Comparability of CPS From Microdata Files With Published Sources

Although total estimates of the population will equal published estimates, labor force estimates produced from a microdata file will not be directly comparable or identical with the published nonseasonally adjusted labor force data. The major reason for this is due to a final estimation procedure incorporated into the production of the published nonseasonally adjusted data. This procedure, known as a composite estimator, is a weighted average of two estimates for the current month for any particular item. The first estimate is the two-stage ratio estimate that includes all the estimation steps given above. The second estimate consists of the composite estimate for the preceding month to which has been added an estimate of the change from the preceding month, based on that part of the sample which is common to the two months (about 75 percent). This procedure is primarily used to increase the reliability of estimates of month-to-month change, although other reliability gains are also realized. As noted above, the composite estimation procedure does not affect estimates of the total population.

Another factor also inhibits microdata comparison with published labor force data. This is the seasonal adjustment that is applied to many published statistics. This adjustment is used to adjust for normal seasonal variations to help distinguish the underlying economic situation in month-to-month changes.

Shown below are data from January and July 1993 which demonstrate how estimates compiled using the final weights from the microdata file may differ from the published composited estimates, with and without seasonal adjustment. Note that the composite estimation procedure was not used for estimates published from January 1994 to May 1994. For a further description of both the composite estimator and seasonal adjustment, see "Explanatory Notes and Estimates of Error: Household Data - Estimating Methods (Composite Estimation Procedure)" and "Seasonal Adjustment" in any issue of Employment and Earnings.

## Comparison of CPS Estimates from Microdata Files with Published Sources

| Noni | Civilian titutional opulation | Civilian Labor Force | Employed | Unemployed | Not in Labor Force |

## ATTACHMENT 3

## OVERVIEW

September 1998, January 1999, and May 1999 Tobacco Use Survey

## General

Census Bureau staff conducted the National Cancer Institute (NCI) Sponsored Tobacco Use Supplement (TUS) to the Current Population Survey (CPS) in conjunction with the September 1998, January 1999 and May 1999 CPS. The CPS is a monthly labor force survey conducted in approximately 48,000 interviewed households across the country. Attachment 9 contains a facsimile of the September 1998, January 1999 and May 1999 Tobacco Use Supplement questions. Attachment 2 comprises a description of the CPS entitled "Overview-Current Population Survey."

Census Bureau staff collected the series of NCI sponsored Tobacco Use Supplements on two other occasions. We conducted the first series in September 1992, January 1993 and May 1993. We conducted the second series in September 1995, January 1996 and May 1996. State data will be most reliable when using data from all three months of collections. For this reason, we recommend that all three files be purchased when analyzing state level data. This is especially important when trying to replicate analysis done by the NCI. Much of their analysis is based on a statistical average of all three collection periods. Each file only contains data collected for the Tobacco Use Supplement in September 1998, January 1999 or May 1999. A suggested citation for these NCI sponsored TUS-CPS (1998-99) data and/or technical documentation and those previously collected in 1992-93 and 1995-96: is US Department of Commerce, Census Bureau , (year of data release). National Cancer Institute Sponsored Tobacco Use Supplement to the Current Population Survey (years of survey). A description of the September 1998, January 1999 and May 1999 Tobacco Use Supplement follows.

Please note that the January and May 1999 Tobacco Use Supplement has different wording for the "other tobacco use" questions than the September 1998 version. In September 1998, the questions were changed to more appropriately capture some day/occasional usage of other tobacco products by changing the previous wording in 1992-93 and 1995-96 from "(Have/Has) (you/name) EVER used pipes, cigars, chewing tobacco or snuff on a regular basis?" to "(Have/Has) (you/name) EVER used pipes, cigars, chewing tobacco or snuff?" and then following with, "Which ones?" then "Do you now use $\qquad$ every day, some days or not at all?" If respondent answered "some days," then we followed up with "On how many of the past 30 days did you use
$\qquad$ ?" In January and May 1999 the wording reverted back to "(Have/Has) (you/name) EVER used pipes, cigars, chewing tobacco or snuff on a regular basis?" Then followed by the same questions as asked in September 1998 ("Which ones?" next "Do you now use $\qquad$ every day, some days or not at all?" If respondent answered "some days" the we followed up with "On how many of the past 30 days did you use
$\qquad$ ?"). It is recommended that for more accurate estimates of other tobacco products the September 1998 data is used alone or in the future averaged with January and May 2000 other tobacco product data. The

January and May 1999 data may be used to compare to the older data in 1992-93 and 1995-96 for the purpose of estimating trends.

## Data Collection

The Tobacco Use Supplement consisted of Items PES32 through PES77. All CPS household members age 15 years and older who had completed CPS Core items were eligible for these items.

Items for Both Proxy and Self-Respondents Self-respondents were eligible for the entire supplement, whereas proxy respondents were only eligible for certain items. We only collected information from proxies on topics, such as smoking status (Items PES32-PES34) and the use of other tobacco products; for example, pipes, cigars, chewing tobacco, and snuff (Items PES62A-PES63B).

Items for Self-Respondents Only In addition to the smoking status and other tobacco use questions, we asked self-respondents various questions depending on their smoking status. We asked former, everyday, and some days smokers a set of detailed prevalence questions tailored to their status (Items PES 36 - PES46 and PES 55- PES61). In addition, we asked current smokers questions, such as whether the medical community had advised them to quit smoking or if they were planning to quit in the near future (PES47-PES54). We also asked all self-respondents detailed questions on smoking policies in their work place (Items PES67-PES71), smoking rules in the home (Item PES73) and questions on opinions about smoking (Items PES72-PES77).

Special Administrative Items We also collected some special questions, such as who the proxy respondents were, the language in which the interview was conducted, the survey method (telephone vs. personal-visit interviews), CATI vs. CAPI, and the date of the interview.

## Data Processing

The data processing involved editing the September 1998, January 1999, and May 1999 supplement data. This process is described below:

## Edits, Allocations, and Recodes

Regular Edits Data processing involved a consistency edit of all supplement items. The consistency edit ensured that the entries within an individual record followed the correct skip pattern. Items with missing entries were assigned values, if appropriate. The remaining items were not allocated.

Other Edits We also edited the supplement data based on patterns of response, such as: (1) making check items consistent with entries; (2) making the various records of proxy/self-consistent with each other; and (3) assigning a code " 88 " in the variable PES78 (located in positions 997:998) when we knew that the interview was done by a proxy, but we did not know by whom.

Recodes We also created an interview status recode and a smoking status recode. The interview status recode is identified by the variable "INTERVIEW" (located in positions 1003:1004), where Code 1 is an
interview and Code 2 is a noninterview. The smoking status recode is identified by the variable "SMOKSTAT" (located in positions 1005:1006) where Code 1 is a "never smoker," Code 2 is an "everyday smoker," Code 3 is a "some days smoker," Code 4 is a "former smoker," and Code -9 is "indeterminate (unknown) smoking status."

The values and universes for each variable are defined in the supplement record layout (Attachment 8).

## Weighting

PWSSWGT for Labor Force Data All adult records retain the "basic CPS weight," which reflects controlling for age, race, sex, and Hispanic origin estimates and individual state 16+ estimates. Use the basic CPS final weight (PWSSWGT) located in positions 613:622 for tallying the labor force items. For a description of this weight, see Attachment 2, "Overview of the CPS."

Special Supplement Weights This file contains two special supplement weights: a supplement nonresponse adjustment weight and a supplement self-response adjustment weight. In addition to maintaining national demographic totals (for age, sex, race, and origin), these weights were designed to maintain each state's population total.

Supplement Non-Response and Self-Response Weights Use the supplement nonresponse adjustment weight (PWNRWGT) located in positions 1009:1018 for tallying the supplement items. When you are interested in self-response analysis (especially for those items requiring self-response only), use the supplement selfresponse adjustment weight (PWSRWGT) in positions 1019:1028 for tallying the supplement items.

Use of Weights When Using All Three Files The best analysis of the Tobacco Use data, especially for states, will come from combining the data from all three collection periods (September 1998, January 1999, and May 1999). To use the weights when combining the three files, divide each weight by three. The source and accuracy statement found in Attachment 17 contains a detailed description on how to use the Tobacco Use weights for single and combined files.

## September 1998, January 1999 and May 1999 NCI Sponsored Tobacco Use Supplement to the CPS File

CPS Labor Force Data The September 1998 CPS file contains 135,549 records. The January CPS file contains 135,889 and the May CPS file contains 134,994 records. The first 856 characters contain the labor force data for each record. Attachment 7 contains the CPS Basic Items Record Layout, which includes the variable name, character size, location on the record, universe, and the possible values of each basic CPS variable included on the file.

The variable PRPERTYP (located in positions 161:162 on the CPS Basic Items Record Layout) determines the type of record as follows:

## PRPERTYP

$1=$ Child household member (0-14 years old)
$2=$ Adult civilian household member ( $15+$ years old)
$3=$ Adult Armed Forces household member ( $15+$ years old $)$

The variable HRINTSTA (located in positions 57:58 on the CPS Basic Items Record Layout) determines the interview status of the household.

## HRINTSTA

$1=$ Interviewed
2 = Type A Noninterview (These records represent households that were eligible for CPS interview but were not interviewed because no one was home, household members were temporarily absent, etc.)

3 = Type B Noninterview (These records represent sample addresses determined to be ineligible for the CPS by virtue of a temporary situation, such as being vacant, nonresidential, etc. These households could become eligible for a CPS interview.)

4 = Type C Noninterview (These records represent sample addresses determined to be ineligible for CPS by virtue of a permanent change such as demolished, condemned, etc. These addresses will not be visited again for CPS interviews.)

By combining the values of PRPERTYP (1-3) and HRINTSTA (2-4), the number for records can be determined. Such as those below for January 1999.

The values of PRPERTYP are:
Unweighted Counts
September 1998 January 1999 May 1999

| $1=$ Child | 27,498 | 27,522 | 26,644 |
| :--- | ---: | ---: | ---: |
| $2=$ Adult Civilian, $15+$ | 94,909 | 94,918 | 94,308 |
| $3=$ Adult, Armed Forces | 422 | 306 | 398 |

The values of HRINTSTA are:

| $2=$ Type A Noninterview | 3,314 | 3,668 | 3,612 |
| ---: | :--- | ---: | ---: | ---: |
| $3=$ Type B Noninterview | 8,983 | 9,124 | 9,549 |
| $4=$ Type C Noninterview | 423 | 351 | 483 |

# ATTACHMENT 4 

## GLOSSARY <br> Current Population Survey

Age-Age classification is based on the age of the person at his/her last birthday. The adult universe (i.e., population of marriageable age) is comprised of persons 15 years and over for CPS labor force data.

#### Abstract

Allocation Flag-Each edited item has a corresponding allocation flag indicating the nature of the edit. See the attachment on allocation flags for more information. The second character of the item name is always "X".

Armed Forces-Demographic information for Armed Forces members (enumerated in off-base housing or on-base with their families) is included on the CPS data files. No labor force information is collected of Armed Forces members in any month. In March, supplemental data on income are included for Armed Forces members. This is the only month that non-demographic information is included for Armed Forces members.

## Civilian Labor Force-(See Labor Force.)

Class of Worker-This refers to the broad classification of the person's employer. These broad classifications for current jobs are:

1) Federal government
2) State government
3) Local government
4) Private industry (including self-employed, incorporated)
5) Self-employed (not incorporated)
6) Working without pay

Domain-The domain for an item is a list or range of its possible values. Note that all unedited items have possible values of -1 (blank), -2 (don't know), and -3 (refused). Since all items have these possible values, they are not shown as valid entries for each item.

Duration of Unemployment-Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed are continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the present period of seeking work.

Earners, Number of-The file includes all persons 15 years old and over in the household with $\$ 1$ or more in wages and salaries, or $\$ 1$ or more of a loss in net income from farm or nonfarm self-employment during the preceding year.

Edited item-An edited item is allocated or imputed by the processing system. In most cases this means allocating a value where the unedited item contains a value of blank, "don't know", or "refused". The second character of the item name is always " E ".

An edited version of an item exists only if that item is processed through the edits. If the edits never deal with a particular item, then that item only has an unedited version.

Since the instrument enforces skip patterns and consistency between many items, the edits are left mainly with the job of allocating missing values. Also, since an interviewer is allowed to "back up" in the interview, there may be "off-path" items filled in the unedited data. The edits also blank these off-path items if an edited version of the items exists.

## Education-(See Level of School Completed.)

## Employed-(See Labor Force.)

Family-A family is a group of two persons or more (one of whom is the householder) residing together and related by birth, marriage, or adoption. All such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family Household-A family household is a household maintained by a family (as defined above), and may include among the household members any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of Family).

Family Weight-This weight is used only for tallying family characteristics. In March, the weight on the family record is the March supplement weight of the householder or reference person.

Final Weight-Used in tabulating labor force items in all months, including March. The final weight is controlled to independent estimates for:

1) States
2) Origin, Sex, and Age
3) Age, Race, and Sex

This weight should not be used when tabulating March supplement data.

Full-Time Worker-Persons on full-time schedules include persons working 35 hours or more, persons who worked 1-34 hours for noneconomic reasons (e.g., illness) and usually work full-time, and persons "with a job but not at work" who usually work full-time.

Group Quarters-Group quarters are noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons unrelated to the person in charge.

Head Versus Householder-Beginning with the March 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used.

## Highest Grade of School Attended-(See Level of School Completed.)

Hispanic Origin-Persons of Hispanic origin in this file are determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents are asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Hispanic origin, in particular, are those who indicated that their origin was Mexican-American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Hispanic.

Hours of Work-Hours of work statistics relate to the actual number of hours worked during the survey week. For example, a person who normally works 40 hours a week but who is off on the Veterans Day holiday is reported as working 32 hours even though he is paid for the holiday.

For persons working in more than one job, the figures related to the number of hours worked in all jobs during the week. However, all the hours are credited to the major job.

Household-A household consists of all the persons who occupy a house, an apartment, or other group of rooms, or a room, which constitutes a housing unit. A group of rooms or a single room is regarded as a housing unit when it is occupied as separate living quarters; that is, when the occupants do not live and eat with any other person in the structure, and when there is direct access from the outside or through a common hall. The count of households excludes persons living in group quarters, such as rooming houses, military barracks, and institutions. Inmates of institutions (mental hospitals, rest homes, correctional institutions, etc.) are not included in the survey.

Household Weight-The household weight is used for tallying household characteristics. In March, the household weight is the March Supplement weight of the householder.

Householder-The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Householder With No Other Relatives in Household-A householder who has no relatives living in the household. This is the entry for a person living alone. Another example is the designated householder of an apartment shared by two or more unrelated individuals.

Householder With Other Relatives (Including Spouse) in Household-The person designated as householder if he/she has one or more relatives (including spouse) living in the household.

Industry, Occupation, and Class of Worker (I\&O)-Current Job (basic data)-For the employed, current job is the job held in the reference week (the week before the survey). Persons with two or more jobs are classified in the job at which they worked the most hours during the reference week. The unemployed are classified according to their latest full-time job lasting two or more weeks or by the job (either full-time or part-time). The I \& O questions are also asked of persons not in the labor force who are in the fourth and eighth months in sample and who have worked in the last five years.

Job Seekers-All unemployed persons who made specific efforts to find a job sometime during the 4-week period preceding the survey week.

Longitudinal Weight-Used for gross flows analysis. Only found on adult records matched from month to month.
PEMLR-(Major Labor Force Recode)-This classification is available for each civilian 15 years old and over according to his/her responses to the monthly (basic) labor force items.

Labor Force-Persons are classified as in the labor force if they are employed, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" includes all civilians classified as employed or unemployed. The file includes labor force data for civilians age 15 and over. However, the official definition of the civilian labor force is age 16 and over.

## 1. Employed

Employed persons comprise (1) all civilians who, during the survey week, do any work at all as paid employees or in their own business or profession, or on their own farm, or who work 15 hours or more as unpaid workers on a farm in a business operated by a member of the family; and (2) all those who have jobs but who are not working because of illness, bad weather, vacation, or labor-management dispute, or because they are taking time off for personal reasons, whether or not they are seeking other jobs. These persons would have a Monthly Labor Force Recode (MLR) of 1 or 2 respectively in characters 180-181 of the person record which designates "at work" and "with a job, but not at work." Each employed person is counted only once. Those persons who held more than one job are counted in the job at which they worked the greatest number of hours during the survey week. If they worked an equal number of hours at more than one job, they are counted at the job they held the longest.

## 2. Unemployed

Unemployed persons are those civilians who, during the survey week, have no employment but are available for work, and (1) have engaged in any specific job seeking activity within the past 4 weeks such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) are waiting to be called back to a job from which they had been laid off; or (3) are waiting to report to a new wage or salary job within 30 days. These persons would have an MLR code of 3 or 4 in characters 180-181 of the person record. The unemployed includes job leavers, job losers, new job entrants, and job reentrants.
a. Job Leavers

Persons who quit or otherwise terminate their employment voluntarily and immediately begin looking for work.
b. Job Losers

Persons whose employment ends involuntarily, who immediately begin looking for work, and those persons who are already on layoff.

## c. New Job Entrants

Persons who never worked at a full-time job lasting two weeks or longer.

## d. Job Reentrants

Persons who previously worked at a full-time job lasting two weeks or longer but are out of the labor force prior to beginning to look for work.

Finally, it should be noted that the unemployment rate represents the number of persons unemployed as a percent of the civilian labor force 16 years old and over. This measure can also be computed for groups within the labor force classified by sex, age, marital status, race, etc. The job loser, job leaver, reentrant, and new entrant rates are each calculated as a percent of the civilian labor force 16 years old and over; the sum of the rates for the four groups thus equals the total unemployment rate.

## 3. Not in Labor Force

All civilians 15 years old and over who are not classified as employed or unemployed. These persons are further classified by major activity: retired, unable to work because of long-term physical or mental illness, and other. The "other" group includes, for the most part, students and persons keeping house. Persons who report doing unpaid work in a family farm or business for less than 15 hours are also classified as not in the labor force.

For persons not in the labor force, data on previous work experience, intentions to seek work again, desire for a job at the time of interview, and reasons for not looking for work are asked only in those households that are in the fourth and eighth months of the sample, i.e., the "outgoing" groups, those which had been in the sample for three previous months and would not be in for the subsequent month.

Persons classified as NILF have an MLR code of 5-7 in characters 180-181 of the person record.
Layoff-A person who is unemployed but expects to be called back to a specific job. If he/she expects to be called back within 30 days, it is considered a temporary layoff; otherwise, it is an indefinite layoff.

Level of School Completed/Degree Received-These data changed beginning with the January 1992 file. A new question, "What is the highest level of school ... has completed or the highest degree ... has received?" replaced the old "Highest grade attended" and "Year completed" questions. The new question provides more accurate data on the degree status of college students. Educational attainment applies only to progress in "regular" school. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to a school in the regular school system.

Looking for Work-A person who is trying to get work or trying to establish a business or profession.

Marital Status-The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of enumeration.

The category "married" is further divided into "married, civilian spouse present," "married, Armed Force spouse present," "married, spouse absent," "married, Armed Force spouse absent," and "separated." A person is classified as "married, spouse present" if the husband or wife is reported as a member of the household even though he or she may be temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as "separated" included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily estranged from their spouses because of marital discord.

For the purpose of this file, the group "other marital status" includes "widowed and divorced," "separated," and "other married, spouse absent."

Month-In-Sample-The term is defined as the number of times a unit is interviewed. Each unit is interviewed eight times during the life of the sample.

Never Worked-A person who has never held a full-time civilian job lasting two consecutive weeks or more.
Nonfamily Householder-A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Nonworker-A person who does not do any work in the calendar year preceding the survey.
Nonrelative of Householder With No Own Relatives in Household-A nonrelative of the householder who has no relative(s) of his own in the household. This category includes such nonrelatives as a foster child, a ward, a lodger, a servant, or a hired hand, who has no relatives of his own living with him in the household.

Nonrelative of Householder With Own Relatives (Including Spouse)in Household-Any household member who is not related to the householder but has relatives of his own in the household; for example, a lodger, his spouse, and their son.

Other Relative of Householder-Any relative of the householder other than his spouse or child; for example, father, mother, grandson, daughter-in-law, etc.

Out Variable-An instrument-created item that stores the results of another item.
Own Child-A child related by birth, marriage, or adoption to the family householder.
Part-Time, Economic Reasons-The item includes slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work. (See also Full-Time Worker.)

Part-Time, Other Reasons-The item includes labor dispute, bad weather, own illness, vacation, demands of home housework, school, no desire for full-time work, and full-time worker only during peak season.

Part-Time Work-Persons who work between 1 and 34 hours are designated as working "part-time" in the current job held during the reference week. For the March supplement, a person is classified as having worked part-time during the preceding calendar year if he worked less than 35 hours per week in a majority of the weeks in which he
worked during the year. Conversely, he is classified as having worked full-time if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Part-Year Work-Part-year work is classified as less than 50 weeks' work.
Population Coverage-Population coverage includes the civilian population of the United States plus approximately 820,000 members of the Armed Forces in the United States living off post or with their families on post but excludes all other members of the Armed Forces. This file excludes inmates of institutions. The labor force and work experience data are not collected for Armed Forces members.

Processing Recode-An item calculated by the processing system from a combination of other items in the database. The second character of the item name is always "R".

Race-The population is divided into three groups on the basis of race: White, Black, and Other races. The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In most of the published tables, "Other Races" are shown in total population.

Reentrants-Persons who previously worked at a full-time job lasting two weeks or longer but who are out of the labor force prior to beginning to look for work.

Related Children-Related children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25 " and "own children of any age," include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

Related Subfamily-A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the householder or spouse. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the number of families.

School-A person who spent most of his time during the survey week attending any kind of public or private school, including trade or vocational schools in which students receive no compensation in money or kind.

Secondary Individual-A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily households and inmates of institutions) who is not related to any other person in the household or group quarters.

Self-Employed-Self-employed persons are those who work for profit or fees in their own business, profession or trade, or operate a farm.

Stretches of Unemployment-A continuous stretch is one that is not interrupted by the person getting a job or leaving the labor market to go to school, to keep house, etc. A period of two weeks or more during which a person is employed or ceased looking for work is considered to break the continuity of the period of seeking work.

Unable to Work-A person is classified as unable to work because of long-term physical or mental illness, lasting six months or longer.

Unedited item-An item that is produced by the CAPI instrument, either collected during the interview or created by the CAPI instrument. The second character of the item name is always "U".

## Unemployed-(See Labor Force.)

Unpaid Family Workers-Unpaid family workers are persons working without pay for 15 hours a week or more on a farm or in a business operated by a member of the household to whom they are related by birth or marriage.

Unrelated Individuals-Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a nonfamily householder living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Unrelated Subfamily-An unrelated subfamily is a family that does not include among its members the householder and relatives of the householder. Members of unrelated subfamilies may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of families. However, the number of such unrelated subfamilies became so small ( 37,000 in 1967) that beginning with the data for 1968 (and beginning with the census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Veteran Status-If a male served at any time during the four major wars of this century, the code for the most recent wartime service is entered. The following codes are used:

0 Children under 15
1 Vietnam era
2 Korean
3 WWI
4 WWII
5 Other Service
6 Nonveteran
Wage and Salary Workers-Wage and salary workers receive wages, salary, commission, tips, or pay in kind from a private employer or from a governmental unit. Also included are persons who are self-employed in an incorporated business.

Workers-(See Labor Force--Employed.)

Work Experience-Includes those persons who during the preceding calendar year did any work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Year-Round Full-Time Worker-A year-round full-time worker is one who usually worked 35 hours or more per week for 50 weeks or more during the preceding calendar year.

## ATTACHMENT 5

## HOW TO USE THE RECORD LAYOUT

Data users familiar with the CPS data files in prior years will see many similarities between the format of this file and those files released before January 1994. As in the past, there are numeric locations on the file which correspond to each variable. There is only one record layout which contains the variables for children, adults, and armed forces members. In prior years, each type of person had a separate record layout.

## Item Naming Conventions

À The first character of each variable name is one of the following:
H - Household item
G - Geography item

* P - Person item (includes adult items, child items, and armed forces items)
* There is no need to distinguish adult, child, and armed forces items in the variable names in the new system. The recode PRPERTYP (located in positions 161-162) tells you what category the person is in.

A The second character of each variable name is one of the following:
E - Edited item
U - Unedited item
X - Allocation flag (see Attachment 16 for more information)
W - Weight
R - Recode
A The remaining characters describe the variable.
À For multiple entry items, the file contains a separate variable for each possible response. Each item has the same descriptive name but a number is added as the last digit. For example, Question 22A allows separate entries for up to 6 job search methods. The item names are PELKM1 (this item is edited), PULKM2, (this item is unedited), PULKM3, etc. These items are located in positions 296-307 of the record layout.

## ATTACHMENT 6

## CHANGES TO CPS PUBLIC USE FILES EFFECTIVE SEPTEMBER 1995

Effective September 1995, a number of revisions were made to the CPS public use files. Most were related to the recent phase-in of a new sample based on the results of the 1990 Census. This phase-in was completed in June 1995. Part of this changeover was the use of new metropolitan area definitions based on the results of the 1990 Decennial Census in selecting the new sample. As such, beginning in September 1995, metropolitan area definitions effective June 30, 1993 will be identified subject to confidentiality restrictions on the CPS public use files. The new variables and their locations are given below.

Concurrent with this revision, several other changes were made to the CPS public use files. The most important of these was the creation of a new set of household identification numbers for the September forward files. Bureau of the Census confidentiality restrictions require that we preclude the possibility of matching any households from data files before and after the September 1995 date. In conjunction with this, the Bureau revised its sample household numbering scheme. These two considerations resulted in the creation of a 15 character household identification number. The location of this number is now in characters 1-15 (previously 1-12) of all non-March files and characters 344-358 (previously 320-331) on the March files.

Also, on non-March files, the following variables changed locations:

| Name | Old |  | Location |
| :--- | :--- | :--- | :--- |
| New |  |  |  |
| HUINTTYP | $13-14$ |  | $16-17$ |
| HULENSEC | $15-19$ | $109-113$ |  |

The other change involves the suppression of several 3-digit occupation codes. Specifically, Codes 003 and 016 (legislators and postmasters, respectively) are collapsed into Code 022, (managers and administrators, N.E.C.) Also, Code 179, (judges) was collapsed into Code 178, (lawyers). None of the changes affected any of the occupation recodes.

All items, except those with one character, also can have values of $-1,-2$, or -3 even if such values are not listed in the documentation. The meanings of these values are as follows:
-1 Blank or not in universe
-2 Don't know
-3 Refused

Most edited items (E or R) in the second character of the item name also can be blank. This means that the record was not in universe for that item.

## ATTACHMENT 10

INDUSTRY CLASSIFICATIONS
Industry Classification Codes for Detailed Industry
(3-digit)
There are 236 categories for the employed, with 1 additional category for the experienced unemployed. These categories are aggregated into 51 detailed groups and 23 major groups (see pages 11-9 through 11-11).
(Numbers in parentheses are the 1987 SIC code equivalent; see Executive Office of the President, Office of Management and Budget, Standard Industrial Classification Manual, 1987. "Pt" means part, "n.e.c." means not elsewhere classified.)

These codes correspond to Items PEIO1ICD and PEIO2ICD located in the adults record layout. These codes are located in positions 436-438 and 446-448 in all months except March. In March, these codes correspond to Item A-IND, positions 103-105.

\section*{OCCUPATION CLASSIFICATIONS}

\section*{Occupational Classification Codes for Detailed Occupational Categories (3-digit)}

There are 500 categories for the employed with 1 additional category for the experienced unemployed. These categories are aggregated into 46 detailed groups and 14 major groups (see pages 12-15 through 12-17).

The classification is developed from the 1980 Standard Occupational Classification. "n.e.c." is the abbreviation \(\mathrm{f}_{\mathrm{\prime}}\) not elsewhere classified.

These codes correspond to Items PEIO1OCD and PEIO2OCD located in the adults record layout. These codes are located in positions 439-441 and 449-451 in all months except March. In March, these codes correspond to Item AOCC, positions 106-108.

Supervisors, Construction Occupations
Supervisors, brickmasons, stonemasons, and tile setters (6312)
Supervisors, carpenters and related workers (6313)
Supervisors, electricians and power transmission installers (6314)
Supervisors, painters, paperhangers, and plasterers (6315)
Supervisors, plumbers, pipefitters, and steamfitters (6316)
Supervisors, construction, n.e.c. \((6311,6318)\)
not used
Construction Trades, Except Supervisors
Brickmasons and stonemasons (part 6412, part 6413)
Brickmason and stonemason apprentices (part 6412, part 6413)
Tile setters, hard and soft (part 6414, part 6462)
Carpet installers (part 6462)
Carpenters (part 6422)
not used
Carpenter apprentices (part 6422)
not used
Drywall installers (6424)
not used
Electricians (part 6432)
Electrician apprentices (part 6432)
Electrical power installers and repairers (6433)
not used
Painters, construction and maintenance (6442)
not used
Paperhangers (6443)
Plasterers (6444)
Plumbers, pipefitters, and steamfitters (part 645)
not used
Plumber, pipefitter, and steamfitter apprentices (part 645)
Concrete and terrazzo finishers (6463)
Glaziers (6464)
not used
Insulation workers (6465)
Paving, surfacing, and tamping equipment operators (6466)
Roofers (6468)
Sheetmetal duct installers (6472)
Structural metal workers (6473)
Drillers, earth (6474)
Construction trades, n.e.c. \((6467,6475,6476,6479)\)
not used
Extractive Occupations
Supervisors, extractive occupations (632)
Drillers, oil well (652)
Explosives workers (653)
Mining machine operators (654)
Mining occupations, n.e.c. (656)
not used
Precision Production Occupations
Supervisors, production occupations \((67,71)\)
not used
Precision Metal Working Occupations
Tool and die makers (part 6811)
Tool and die maker apprentices (part 6811)

Precision assemblers, metal (6812)
Machinists (part 6813)
not used
Machinist apprentices (part 6813)
not used
Boilermakers (6814)
Precision grinders, filers, and tool sharpeners (6816)
Patternmakers and model makers, metal (6817)
Lay-out workers (6821)
Precious stones and metals workers (Jewelers) \((6822,6866)\)
not used
Engravers, metal (6823)
not used
Sheet metal workers (part 6824)
Sheet metal worker apprentices (part 6824)
Miscellaneous precision metal workers (6829)
Precision Woodworking Occupations Patternmakers and model makers, wood (6831)
Cabinet makers and bench carpenters (6832)
Furniture and wood finishers (6835)
Miscellaneous precision woodworkers (6839) not used
Precision Textile, Apparel, and Furnishings Machine Workers Dressmakers (part 6852, part 7752)
Tailors (part 6852)
Upholsterers (6853)
Shoe repairers (6854)
not used
Miscellaneous precision apparel and fabric workers (6856, 6859, part 7752)
Precision Workers, Assorted Materials
Hand molders and shapers, except jewelers (6861)
Patternmakers, lay-out workers, and cutters (6862)
Optical goods workers (6864, part 7477, part 7677)
Dental laboratory and medical appliance technicians (6865)
Bookbinders (6844)
not used
Electrical and electronic equipment assemblers (6867)
Miscellaneous precision workers, n.e.c. (6869)
not used
Precision Food Production Occupations
Butchers and meat cutters (6871)
Bakers (6872)
Food batchmakers \((6873,6879)\)
Precision Inspectors, Testers, and Related Workers
Inspectors, testers, and graders \((6881,828)\)
not used
Adjusters and calibrators (6882)
Plant and System Operators
Water and sewage treatment plant operators (691)
Power plant operators (part 693)
Stationary engineers (part 693, 7668)
not used
Miscellaneous plant and system operators (692, 694, 695, 696) not used

\section*{ATTACHMENT 12}

\section*{Specific Metropolitan Identifiers}

The specific metropolitan identifiers on this file are based on the Office of Management and Budget's June 30, 1993 definitions. MSA's and PMSA's can be identified by using the FIPS MSA/PMSA code (List 3). Identification of individual central cities is based on acombination of codes (List 2). Individual central cities are identified by the appropriate central city code and the FIPS MSA/PMSA code. Some examples of the proper coding of specific metropolitan areas are given below:
\begin{tabular}{|c|c|c|c|}
\hline AREA & INDIVIDUAL CENTRAL CITY CODE (GEINDVCC) & \begin{tabular}{l}
FIPS \\
MSA/PMSA \\
CODE \\
(GEMSA)
\end{tabular} & \begin{tabular}{l}
FIPS \\
CMSA \\
CODE \\
(GECMSA)
\end{tabular} \\
\hline & List 4 & List 2 or 3 & List 1 or 2 \\
\hline Dallas-Fort Worth, TX CMSA & N/C & 1920 and 2800 & 31 \\
\hline Fort Worth-Arlington, TX PMSA & N/C & 2800 & N/C \\
\hline Fort Worth, TX Central City & 1 & 2800 & N/C \\
\hline Phoenix, AZ MSA & N/C & 6200 & N/C \\
\hline Mesa, AZ Central City & 2 & 6200 & N/C \\
\hline Burlington, VT MSA & N/C & 1305 & N/C \\
\hline \multicolumn{4}{|c|}{N/C = No Code Required} \\
\hline
\end{tabular}

\section*{NOTE:}

Many of the smaller metropolitan areas in sample do not contain central city/balance breakdowns and hence, are coded "not identifiable" in the household metropolitan statistical area residence status code (GEMSAST). It is recommended that this code in conjunction with the modified household metropolitan statistical area residence status code (GEMETSTA) be used for tallying metropolitan residence status for national and other grouped data. The GE in each variable name refers to Household Geographic.

\section*{Topcoding of Usual Hourly Earnings}

This variable will be topcoded based on an individual's usual hours worked variable, if the individual's edited usual weekly earnings variable is \(\$ 999\). The topcode is computed such that the product of usual hours times usual hourly earnings does not exceed an annualized wage of \(\$ 100,000(\$ 1,923.07\) per week). Below is a list of the appropriate topcodes.
\begin{tabular}{|c|c|c|c|c|c|}
\hline Hours & Topcode & Hours & Topcode & Hours & Topcode \\
\hline 1 & None & 34 & \$56.56 & 67 & \$28.70 \\
\hline 2 & None & 35 & \$54.94 & 68 & \$28.28 \\
\hline 3 & None & 36 & \$53.41 & 69 & \$27.87 \\
\hline 4 & None & 37 & \$51.97 & 70 & \$27.47 \\
\hline 5 & None & 38 & \$50.60 & 71 & \$27.08 \\
\hline 6 & None & 39 & \$49.30 & 72 & \$26.70 \\
\hline 7 & None & 40 & \$48.07 & 73 & \$26.34 \\
\hline 8 & None & 41 & \$46.90 & 74 & \$25.98 \\
\hline 9 & None & 42 & \$45.78 & 75 & \$25.64 \\
\hline 10 & None & 43 & \$44.72 & 76 & \$25.30 \\
\hline 11 & None & 44 & \$43.70 & 77 & \$24.97 \\

\section*{COUNTRIES AND AREAS OF THE WORLD}

\section*{Current Population Survey}

\section*{List A -- Alphabetical List of Countries and Areas of the World}

If the specific country reported was not on the interviewer's list, or if the respondent did not know the specific country, the following codes for broad areas of the world were available for coding:
\begin{tabular}{ll} 
Code & Name \\
& \\
148 & Europe \\
245 & Asia \\
252 & Middle East \\
304 & North America \\
318 & Central America \\
353 & Caribbean \\
389 & South America \\
468 & North Africa \\
462 & Other Africa \\
527 & Pacific Islands \\
555 & Elsewhere (includes country not known)
\end{tabular}

The countries (or areas) shown below were coded separately, if reported.
\begin{tabular}{llll} 
Code & Name & Code & Name \\
& & & \\
200 & Afghanistan & 213 & Iraq \\
60 & American Samoa & 119 & Ireland/Eire \\
375 & Argentina & 214 & Israel \\
185 & Armenia & 120 & Italy \\
501 & Australia & 343 & Jamaica \\
102 & Austria & 215 & Japan \\
130 & Azores & 216 & Jordan \\

\section*{ALLOCATION FLAGS}

\section*{Current Population Survey}

For every edited item, there is a corresponding allocation flag with the prefix "PX". The last six characters of the names are the same. For example, PXMLR is the allocation flag for PEMLR. All allocation flags have the following list of possible values.

\author{
00 VALUE - NO CHANGE \\ 01 BLANK - NO CHANGE \\ 02 DON'T KNOW - NO CHANGE \\ 03 REFUSED - NO CHANGE \\ 10 VALUE TO VALUE \\ 11 BLANK TO VALUE \\ 12 DON'T KNOW TO VALUE \\ 13 REFUSED TO VALUE \\ 20 VALUE TO LONGITUDINAL VALUE \\ 21 BLANK TO LONGITUDINAL VALUE \\ 22 DON'T KNOW TO LONGITUDINAL VALUE \\ 23 REFUSED TO LONGITUDINAL VALUE \\ 30 VALUE TO ALLOCATED VALUE LONG. \\ 31 BLANK TO ALLOCATED VALUE LONG. \\ 32 DON'T KNOW TO ALLOCATED VALUE LONG. \\ 33 REFUSED TO ALLOCATED VALUE LONG. \\ 40 VALUE TO ALLOCATED VALUE \\ 41 BLANK TO ALLOCATED VALUE \\ 42 DON'T KNOW TO ALLOCATED VALUE \\ 43 REFUSED TO ALLOCATED VALUE \\ 50 VALUE TO BLANK \\ 52 DON'T KNOW TO BLANK \\ 53 REFUSED TO BLANK
}

\section*{ATTACHMENT 17}

\section*{Source and Accuracy of the CPS Microdata Files \\ for Tobacco Use Supplements}

\section*{SOURCE OF DATA}

The data in these microdata files come from data obtained in September of 1998, January of 1999, and May of 1999 in the Current Population Survey (CPS). The Census Bureau conducts the survey every month, although these files use data only from these months. The survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Field representatives ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The CPS sample includes coverage in all 50 states and the District of Columbia. The Census Bureau continually updates the sample to account for new residential construction. The Census Bureau divides the United States into 2,007 geographic areas. In most states, a geographic area consists of a county or several contiguous counties. In some areas of New England and Hawaii, the Census Bureau uses minor civil divisions instead of counties. We select a total of 754 geographic areas for sample. About 50,000 occupied housing units are eligible for interview each month. Field representatives are unable to obtain interviews at about 3,200 of these units because the occupants are not found at home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Census Bureau has redesigned the CPS sample several times. These redesigns have improved the quality and accuracy of the data and have satisfied changing data needs. The Census Bureau completely implemented the most recent changes due to the 1990 census-based redesign in July 1995.

September 1998, January 1999, and May 1999 Supplements. In addition to the basic CPS questions, field representatives asked supplementary questions in these months about tobacco use.

Due to wording changes on the supplement, the data from September 1998 should not be combined with the data from January and May 1999 when obtaining results for other tobacco products (i.e. cigar, pipe, chewing tobacco and/or snuff). The estimates for at least cigars and possibly other non-cigarette products will be underestimated with the wording used in January and May 1999, although these estimates will be more consistent with the older 1992-1993 and 1995-1996 data for trend purposes. The best estimate for these products would be made from the September 1998 data alone. For trend purposes estimating results for other tobacco products, an average of the January and May 1999 values may be used to be more consistent with but not identical to the older wording.

CPS Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by state, age, gender, race, and

\section*{Hispanic/non-Hispanic categories.}

The independent estimates are based on:
- Statistics from the 1990 Decennial Census of Population.
- An adjustment for undercoverage in the 1990 census.
- Statistics on births, deaths, immigration, and emigration.
- Statistics on the size of the Armed Forces.

The independent population estimates used for 1994 and later are based on updates to controls established by the 1990 decennial census. The independent population estimates include some, but not all, undocumented immigrants.

Supplement Estimation Procedure. In addition to the CPS estimation procedure, the tobacco use supplement uses a supplement noninterview adjustment and a supplement self-response adjustment. The supplement noninterview adjustment accounts for occupied sample households that responded to and completed the CPS, but not to the supplement questionnaire. The self-response adjustment accounts for the elimination of interviews which were completed by proxy.

NOTE: The CPS household weight (HWHHWGT) adjusts for household nonresponse. Additional calculations are needed to create a supplement household weight.

There are two sets of weights on this microdata file. The nonresponse weight (PWNRWGT) includes only the noninterview adjustment. The self-response weight (PWSRWGT) includes both the noninterview adjustment anc the self-response adjustment.

\section*{ACCURACY OF THE ESTIMATES}

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: nonsampling and sampling. The accuracy of an estimate depends on both types of error, but the full effect of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates.

The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but they do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. We can attribute nonsampling errors to several sources, including the following:
- Inability to obtain information about all cases in the sample.
- Definitional difficulties.
- Differences in the interpretation of questions.
- Respondents' inability or unwillingness to provide correct information.
- Respondents' inability to recall information.
- Errors made in data collection, such as in recording or coding the data.
- Errors made in processing the data.
- Errors made in estimating values for missing data.
- Failure to represent all units with the sample (undercoverage).

Nonresponse rates for the basic CPS and supplement were:
Table A. Nonresponse Rates
\begin{tabular}{|c|c|c|c|}
\hline \multirow{2}{*}{ Month } & \multicolumn{3}{|c|}{ Nonresponse Rates } \\
\cline { 2 - 4 } & Basic CPS & \begin{tabular}{c} 
Supplement - \\
Total
\end{tabular} & \begin{tabular}{c} 
Supplement \\
Self Only
\end{tabular} \\
\hline September 1998 & \(6.5 \%\) & \(13.0 \%\) & \(31.6 \%\) \\
\hline January 1999 & \(7.1 \%\) & \(15.4 \%\) & \(35.1 \%\) \\
\hline May 1999 & \(7.1 \%\) & \(18.0 \%\) & \(38.6 \%\) \\
\hline
\end{tabular}

The basic CPS nonresponse rates are for households; nonresponse rates for the supplement are for people. In order for an individual to be eligible for the supplement, an individual's CPS must have been completed. The "Supplement - Total" column allows proxy interviews. The "Supplement - Self Only" column counts proxy responses as noninterviews.

CPS undercoverage results from missed housing units and missed people within sample households. Compared with the level of the 1990 decennial census, overall CPS undercoverage is about 8 percent. Undercoverage varies with age, gender, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-gender-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed people in missed households or missed people in interviewed households have different characteristics from those of interviewed people in the same age-gender-race-Hispanic group.

A common measure of survey coverage is the coverage ratio, the estimated population before ratio adjustment divided by the independent population control. Table B shows CPS coverage ratios for age-gender-race groups for a recent month. The CPS coverage ratios can exhibit some variability from month to month, but these are a
typical set of coverage ratios. Other Census Bureau household surveys experience similar coverage.
Table B. CPS Coverage Ratios
\begin{tabular}{lccccccc}
\hline & \multicolumn{2}{c}{ Non-Black } & \multicolumn{2}{c}{ Black } & \multicolumn{3}{c}{ All People } \\
\hline Age & Male & Female & Male & Female & Male & Female & Total \\
\hline \(0-14\) & 0.929 & 0.964 & 0.850 & 0.838 & 0.916 & 0.943 & 0.929 \\
15 & 0.933 & 0.895 & 0.763 & 0.824 & 0.905 & 0.883 & 0.895 \\

\(15+\) & 0.914 & 0.945 & 0.767 & 0.874 & 0.898 & 0.927 & 0.918 \\
\(0+\) & 0.918 & 0.949 & 0.793 & 0.864 & 0.902 & 0.931 & 0.921 \\
\hline
\end{tabular}

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, An Error Profile: Employment as Measured by the Current Population Survey, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 63, The Current Population Survey: Design and Methodology, Bureau of the Census, U.S. Department of Commerce.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results fron different sources.

Data users should also use caution when comparing estimates in these microdata files (which reflect 1990 censusbased population controls) with estimates for \(1992^{1}\) and earlier years (which reflect 1980 census-based population controls). This change in population controls had relatively little impact on summary measures such a means, medians, and percentage distributions. It did have a significant impact on levels. For example, 1990based population controls caused about a 1-percent increase in the civilian noninstitutional population and in the

11990 based weights are available for 1992-1993 data upon request.
number of families and households. Thus, estimates of levels for data collected in 1993 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since the Census Bureau did not use independent population control totals for people of Hispanic origin before 1985, compare Hispanic estimates over time cautiously.

Note When Using Small Estimates. The Census Bureau shows summary measures (such as medians, means, and percentage distributions) only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, we display estimated numbers even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

Standard Errors and Their Use. Data users must use a number of approximations to derive, at a moderate cost, standard errors applicable to all estimates in these microdata files. Instead of providing an individual standard error for each estimate, we have provided two parameters, a and \(b\), to calculate standard errors for each type of characteristic.

These parameters are designed to estimate the standard error of the number of people with a certain characteristic, not the number of tobacco products. For example, use formula (1) below to estimate the standard error of the number of people who have ever smoked, and use formula (2) to estimate the standard error of the percentage of people reporting a smoke-free environment. To estimate the standard error of a number of tobacco products, such as the average number of cigarettes smoked per day, use formula (6). This formula is based on the distribution of the number of people using different amounts of tobacco products.

The a and b parameters are listed in Tables C and D . Table C shows parameters to use for basic CPS monthly labor force characteristics. Three sets of parameters are listed in Table D: one set for estimates coming from one month of data, a set for estimates combining two months of data, and a separate set for estimates derived by combining all three months of data. In the case of estimating "other tobacco product usage" averaging the "older less valid" two months of 1999 data or in the future averaging two months of more valid 2000 data, use the two combined months parameters in Table D.

The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range that would include the average result of all possible samples with a known probability. For example, if al possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the
intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Data users may also use standard errors to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. A common type of hypothesis is that the population parameters are different. An example of this would be comparing the proportion of male everyday smokers to the proportion of female everyday smokers.

One can perform tests at various levels of significance, where a significance level of a test is the probability of concluding that the characteristics are different when, in fact, they are the same. To conclude that two parameters are different at the 0.10 level of significance, for example, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.645 times the standard error of the difference.

The Census Bureau uses 90-percent confidence intervals and 0.10 levels of significance to determine statistical validity. Consult standard statistical textbooks for alternative criteria.

Standard Errors of Estimated Numbers. The approximate standard error, \(\mathrm{s}_{\mathrm{x}}\), of an estimated number from these microdata files can be obtained by use of the formula
\[
\begin{equation*}
s_{x}=\sqrt{a x^{2}+b x} \tag{1}
\end{equation*}
\]

Here, x is the size of the estimate and a and b are the parameters from Table C or D for the particular characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the set of parameters which gives the largest standard error.

Illustration. In September 1998 there were 35,952,000 people who were everyday smokers. Use the appropriate parameters from Table D and formula (1) to get
\begin{tabular}{lr} 
Number, x & \(35,952,000\) \\
a parameter & -0.000015 \\
b parameter & 3,067 \\
Standard error & 301,000 \\
\(90 \%\) conf. int. & \(35,457,000\) to \\
& \(36,447,000\)
\end{tabular}

The standard error is calculated as
\[
s_{x}=\sqrt{-0.000015 \times 35,952,000^{2}+3,067 \times 35,952,000}=301,000
\]

The 90 -percent confidence interval is calculated as \(35,952,000 \pm 1.645 \times 301,000\). A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more.

When the numerator and denominator of the percentage are in different categories, use the parameter indicated by the numerator.

The approximate standard error, \(\mathrm{s}_{\mathrm{x}, \mathrm{p}}\), of an estimated percentage can be obtained using the formula
\[
\begin{equation*}
s_{x, p}=\sqrt{\frac{b}{x} p(100-p)} \tag{2}
\end{equation*}
\]

Here \(x\) is the total number of people, families, households, or unrelated individuals in the base of the percentage, p is the percentage ( \(0 \# \mathrm{p} \# 100\) ), and b is the parameter from Table C or D associated with the characteristic in the numerator of the percentage.

Illustration. In September 1998, 7.7 percent out of 5,463,000 Black, non-Hispanics aged 15-24 were everyday smokers. Use the appropriate parameter from Table D and formula (2) to get
\begin{tabular}{lr} 
Percentage, p & 7.7 \\
Base, \(x\) & \(5,463,000\) \\
b parameter & 3,140 \\
Standard error & 0.6 \\
\(90 \%\) conf. int. & 6.7 to 8.7
\end{tabular}

The standard error is calculated as
\[
s_{\mathrm{x}, \mathrm{p}}=\sqrt{\frac{3,140}{5,463,000} 7.7(100-7.7)}=0.6
\]

The 90-percent confidence interval for the estimated percentage of Black, non-Hispanics aged 15-24 who smoke every day is calculated as \(7.7 \pm 1.645 \times 0.6\).

Standard Errors of Estimated Differences. The standard error of the difference between two sample estimates is approximately equal to
\[
\begin{equation*}
s_{x-y}=\sqrt{s_{x}^{2}+s_{y}^{2}} \tag{3}
\end{equation*}
\]
where \(s_{x}\) and \(s_{y}\) are the standard errors of the estimates, \(x\) and \(y\). The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration. In May 1999, 17.1 percent of the 26,651,000 non-Black, non-Hispanics aged 15 to 24 years old were everyday smokers compared to 6.6 percent of the \(5,481,000\) Black non-Hispanics of the same age group. The apparent difference between the two groups was 10.5 percent. Use the appropriate parameters from Table D and formulas (2) and (3) to get
\begin{tabular}{lrrr} 
& x & y & difference \\
& & & \\
Percentage & 17.1 & 6.6 & 10.5 \\
Base & \(26,651,000\) & \(5,481,000\) & - \\
b parameter & 3,067 & 3,140 & - \\
Standard error & 0.40 & 0.59 & 0.71 \\
\(90 \%\) conf. int. & 16.4 to 17.8 & 5.6 to 7.6 & 9.3 to 11.7
\end{tabular}

The standard error of the difference is calculated as
\[
s_{x-y}=\sqrt{0.40^{2}+0.59^{2}}=0.71
\]

The 90-percent confidence interval for the estimated difference is \(10.5 \pm 1.645 \times 0.71\). Because this interval does not contain zero, we can conclude with 90 -percent confidence that the percentage of everyday smokers among non-Black non-Hispanics aged 15 to 24 years old is greater than that of Black non-Hispanics in the same age group.

Standard Error of a Ratio. The standard error of a ratio, x/y, may be computed using
\[
\begin{equation*}
s_{x / y}=\frac{x}{y} \sqrt{\left(\frac{s_{x}}{x}\right)^{2}+\left(\frac{s_{y}}{y}\right)^{2}-2 r \frac{s_{x} s_{y}}{x y}} \tag{4}
\end{equation*}
\]

The standard error of the numerator, \(\mathrm{s}_{\mathrm{x}}\), and that of the denominator, \(\mathrm{s}_{\mathrm{y}}\), may be calculated using formulas described earlier. In formula (4), r represents the correlation between the numerator and the denominator of the estimate. (The r is assumed to be zero.)

Illustration. Suppose you want to calculate the standard error and a 90 percent confidence interval for the ratio of non-Black non-Hispanic every day smokers, x , to Black non-Hispanic every day smokers, y , who are
between 15 and 24 years of age. In January 1999, there were 4,096,000 non-Black non-Hispanic every day smokers aged 15 to 24 and 283,000 Black, non-Hispanic every day smokers of the same age, giving a ratio of 14.47. Use the appropriate parameters from Table D and formula (4) to get
\begin{tabular}{lrrr} 
& x & y & ratio \\
Estimate & \(4,096,000\) & 283,000 & 14.47 \\
a parameter & -0.000015 & -0.000124 & - \\
b parameter & 3,067 & 3,140 & - \\
Standard error & 111,000 & 30,000 & 1.58 \\
\(90 \%\) conf. int. & \(3,913,000\) to & 234,000 to & 11.87 to \\
& \(4,279,000\) & 332,000 & 17.07
\end{tabular}

The standard error of the ratio is calculated as
\[
s_{x / y}=\frac{4,096,000}{283,000} \sqrt{\left(\frac{111,000}{4,096,000}\right)^{2}+\left(\frac{30,000}{283,000}\right)^{2}}=1.58
\]

The 90 percent confidence interval for the ratio is calculated as \(14.47 \pm 1.645 \times 1.58\).
Note: This ratio estimation procedure is also useful for calculation of a "quit ratio." That is, the ratio of the number of former smokers to the number of ever (current and former) smokers.

Accuracy of State Estimates. The redesign of the CPS following the 1980 census provided an opportunity to increase efficiency and accuracy of state data. All strata are now defined within state boundaries. The sample is allocated among the states to produce state and national estimates with the required accuracy while keeping total sample size to a minimum. Improved accuracy of state data has been achieved with about the same sample size as in the 1970 design.

Since the CPS is designed to produce both state and national estimates, the proportion of the total population sampled and the sampling rates differ among the states. In general, the smaller the population of the state the larger the sampling proportion. For example, in Vermont approximately 1 in every 400 households was sampled each month. In New York the sample was about 1 in every 2,100 households. Nevertheless, the size of the sample in New York is five times larger than in Vermont because New York has a larger population.

Computation of Standard Errors for State Estimates. Standard errors for a state may be obtained by adjusting the a and b parameters and using the standard error equations described earlier. Multiply the a and b parameters in Table C or D by the appropriate factors from Table E to obtain state parameters. There are separate sets of factors for estimates coming from one month of data and for estimates coming from all three months of data.

Illustration. In January 1999, there were 1,143,000 males living in New York who were everyday smokers. To obtain state parameters for New York, multiply the parameters in Table D by the appropriate factor in Table \(E\) for the state of interest. For males in New York for tobacco use this gives \(a=-0.000029 \times 0.89=-\) 0.000026 and \(b=3,067 \times 0.89=2,730\). Use these parameters and formula (1) to get
\begin{tabular}{lr} 
Number, \(x\) & \(1,143,000\) \\
a parameter & -0.000026 \\
b parameter & 2,730 \\
Standard error & 56,000 \\
\(90 \%\) conf. int. & \(1,051,000\) to \\
& \(1,235,000\)
\end{tabular}

The standard error is calculated as
\[
s_{x}=\sqrt{-0.000026 \times 1,143,000^{2}+2,730 \times 1,143,000}=56,000
\]

The 90-percent confidence interval is calculated as \(1,143,000 \pm 1.645 \times 56,000\).

Computation of a Factor for Groups of States. The factor adjusting standard error parameters for a group of states may be obtained by computing a weighted sum of the factors for the individual states in the group. Depending on the combination of states, the resulting figure can be an overestimate.

The factor for a group of n states is given by
\[
\begin{equation*}
\mathrm{f}=\frac{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}} \times \mathrm{f}_{\mathrm{i}}}{\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{POP}_{\mathrm{i}}} \tag{5}
\end{equation*}
\]
where \(\mathrm{POP}_{\mathrm{i}}\) is the state population and \(\mathrm{f}_{\mathrm{i}}\) is obtained from Table E. The 1999 civilian noninstitutional population (15+) from the CPS for each state is also given in Table E.

Illustration. Suppose a factor for the state group Illinois-Indiana-Michigan was required for data combined from all three months for 1998-1999. The appropriate factor would be
\[
\mathrm{f}=\frac{9,112,000 \times 0.95+4,498,000 \times 1.30+7,482,000 \times 0.86}{9,112,000+4,498,000+7,482,000}=0.99
\]

Multiply the a and b parameters by \(\mathrm{f}=0.99\) to obtain parameters for this state group.

Standard Errors of a Mean for Grouped Data. The formula used to estimate the standard error of a mean for grouped data is
\[
\begin{equation*}
\mathrm{s}_{\mathrm{x}}=\sqrt{\frac{\mathrm{b}}{\mathrm{y}} \mathrm{~S}^{2}} \tag{6}
\end{equation*}
\]

In this formula, y is the size of the base of the distribution and b is the appropriate parameter from Table C or D . The variance, \(S^{2}\), is given by the following formula:
\[
\begin{equation*}
S^{2}=\sum_{i=1}^{c} p_{i} \bar{x}_{i}^{2}-\bar{x}^{2} \tag{7}
\end{equation*}
\]
where \(\bar{x}\), the mean of the distribution, is estimated by
\[
\begin{equation*}
\overline{\mathrm{x}}=\sum_{\mathrm{i}=1}^{\mathrm{c}} \mathrm{p}_{\mathrm{i}} \overline{\mathrm{x}}_{\mathrm{i}} \tag{8}
\end{equation*}
\]
c is the number of groups, i indicates a specific group, thus taking on values 1 through c , \(\mathrm{p}_{\mathrm{i}}\) is the estimated proportion of households, families or people whose values, for the characteristic ( x -values) being considered, fall in group i ,
\(\overline{\mathrm{X}}_{\mathrm{i}}\)
\(\mathrm{X}_{\mathrm{i}}\) is \(\left(\mathrm{Z}_{\mathrm{i}-1}+\mathrm{Z}_{\mathrm{i}}\right) / 2\) where \(\mathrm{Z}_{\mathrm{i}-1}\) and \(\mathrm{Z}_{\mathrm{i}}\) are the lower and upper interval boundaries, respectively, for group i .
\(\overline{x^{\prime}}\)
\(\mathrm{X}_{\mathrm{i}}\) is assumed to be the most representative value of the characteristic for households, families, and unrelated individuals or people in group i. Group c is open-ended, i.e., no upper interval boundary exists. For this group the approximate average value is
\[
\begin{equation*}
\overline{\mathrm{x}}_{\mathrm{c}}=\frac{3}{2} \mathrm{Z}_{\mathrm{c}-1} \tag{9}
\end{equation*}
\]

Illustration. For illustrative purposes, suppose that in September 1998 there were 36,711,000 everyday smokers among self respondents and the distribution of the mean number of cigarettes consumed per everyday smoker per day was
\begin{tabular}{cc} 
Cigarettes per Day & Percent of Smokers \\
\(1-10\) & \(28 \%\) \\
\(11-20\) & \(50 \%\) \\
\(21-30\) & \(13 \%\) \\
\(31-40\) & \(8 \%\) \\
\(41+\) & \(2 \%\)
\end{tabular}

First, \(\bar{x}_{1}=(1+10) / 2=5.5\). Similarly, \(\bar{x}_{2}=15.5, \bar{x}_{3}=25.5, \bar{x}_{4}=35.5\). Then, using formula (9), \(\bar{x}_{5}=\) \((3 / 2) 40=60\). Using formula (8),
\[
\overline{\mathrm{x}}=(.28)(5.5)+(.50)(15.5)+(.13)(25.5)+(.08)(35.5)+(.02)(60.0)=16.65
\]
and using formula (7),
\[
\begin{aligned}
S^{2} & =(.28)(5.5)^{2}+(.50)(15.5)^{2}+(.13)(25.5)^{2}+(.08)(35.5)^{2}+(.02)(60.0)^{2}-(16.65)^{2} \\
& =385.95-277.22=108.73 .
\end{aligned}
\]

Finally, using formula (6) with
\begin{tabular}{lr} 
Mean, \(\overline{\mathrm{X}}\) & 16.65 \\
Base, y & \(36,711,000\) \\
b parameter \(^{2}\) & 3,067 \\
S \(^{2}\) & 108.73 \\
Standard error, \(^{\text {S }}{ }^{-}\) & 0.11 \\
90\% conf. int. & 16.47 to 16.83
\end{tabular}

Because this data is from self respondents, the b parameter is multiplied by 1.23 as indicated in the footnote of Table D. Therefore, the standard error is calculated as
\[
s_{\mathrm{x}}=\sqrt{\frac{3,067 \times 1.23}{36,711,000} \times 108.73}=0.11
\]

The 90-percent confidence interval is calculated as \(16.65 \pm 1.645 \times 0.11\). A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Illustration. Suppose that there were \(8,256,000\) some day smokers among self respondents and the distribution of the mean number of cigarettes consumed per some day smoker per day was
\begin{tabular}{cc} 
Cigarettes per Day & Percent of Smokers \\
1 & \(8 \%\) \\
2 & \(15 \%\) \\
3 & \(36 \%\) \\
4 & \(29 \%\) \\
\(5+\) & \(12 \%\)
\end{tabular}

Then, using formula (8), \(\overline{\mathrm{x}}=3.34\) and using formula (7), \(\mathrm{S}^{2}=1.72\).
Using formula (6) with
\begin{tabular}{lr} 
Mean, \(\overline{\mathrm{X}}\) & 3.34 \\
Base, y & \(8,256,000\) \\
b parameter \(^{\text {' }^{2}}\) & 3,067 \\
Standard error, \(^{\text {S }} \overline{\mathrm{x}}\) & 1.72 \\
90\% conf. int. & 0.03 \\
& 3.29 to 3.39
\end{tabular}

Because this data is from self respondents, the b parameter is multiplied by 1.23 as indicated in the footnote of Table D. Therefore, the standard error is calculated as
\[
s_{x}^{-}=\sqrt{\frac{3,067 \times 1.23}{8,256,000} \times 1.72}=0.03
\]

The 90 -percent confidence interval is calculated as \(3.34 \pm 1.645 \times 0.03\). A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Aggregates. Aggregates such as the total number of cigarettes consumed are computed by multiplying the mean number of cigarettes consumed per smoker, \(\overline{\mathrm{x}}\), by the total number of smokers, y:
\[
T=\bar{x} y
\]
where T is the aggregate to be computed.

Both \(\overline{\mathrm{x}}\) and y have a standard error, so the standard error of a product must be computed. Approximate the standard error of an aggregate with the formula
\[
\begin{equation*}
s_{\mathrm{T}}=\sqrt{\overline{\mathrm{x}}^{2} \mathrm{~s}_{\mathrm{y}}^{2}+\mathrm{y}^{2} \mathrm{~s} \frac{2}{\mathrm{x}}} \tag{10}
\end{equation*}
\]
where \(s_{\bar{x}}\) is computed using formula (6) and \(s_{y}\) is computed using formula (1). In the above formula, the correlation between \(\overline{\mathrm{x}}\) and y is assumed to be zero. If it is actually positive (negative), then this formula will underestimate (overestimate) the standard error of the product.

Illustration. Continuing with the hypothetical example above, suppose that the estimate for the total number of everyday smokers was \(36,711,000\) people and that these people smoked an average of 16.65 cigarettes per day. These people then would consume approximately \(611,238,000\) cigarettes per day. Use formulas (6) and
(1) to get \(S_{\bar{x}}\) and \(S_{y}\) and formula (10) to get
\begin{tabular}{lr} 
& 16.65 \\
Mean, \(\overline{\mathrm{X}}\) & 0.10 \\
Standard error of mean, \({ }^{-} \overline{\mathrm{x}}\) & \(36,711,000\) \\
Base, y & 304,000 \\
Standard error of base, \(\mathrm{s}_{\mathrm{y}}\) & \(611,238,000\) \\
Estimate, T & \(6,253,000\) \\
Standard error, \(\mathrm{s}_{\mathrm{T}}\) & \(600,952,000\) to \\
\(90 \%\) conf. int. & \(621,524,000\)
\end{tabular}

The standard error is calculated as
\[
s_{T}=\sqrt{\left(16.65^{2} \times 304,000^{2}\right)+\left(36,711,000^{2} \times 0.10^{2}\right)}=6,253,000
\]

The 90 -percent confidence interval is calculated as \(611,238,000 \pm 1.645 \times 6,253,000\). A conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Error of a Mean for Daily Amount Smoked by Current Smokers. The formula used to estimate the standard error of a mean for daily amount smoked is
\[
\begin{equation*}
s_{\bar{x}}=\sqrt{\left[\frac{P\left(C_{1}-C_{2}\right)}{(E+P)^{2}}\right]^{2} s_{E}{ }^{2}+\left[\frac{E\left(C_{2}-C_{1}\right)}{(E+P)^{2}}\right]^{2} s_{P}{ }^{2}+\left(\frac{E}{E+P}\right)^{2} s_{C_{1}}{ }^{2}+\left(\frac{P}{E+P}\right)^{2} s_{C_{2}}{ }^{2}} \tag{11}
\end{equation*}
\]
where E is the estimated population of every day smokers,
\(\mathrm{s}_{\mathrm{E}}\) is the standard error of the estimated population of every day smokers, \(P\) is the estimated population of some day smokers, \(\mathrm{s}_{\mathrm{P}}\) is the standard error of the estimated population of some day smokers, \(\mathrm{C}_{1}\) is the amount an every day smoker smokes per day averaged over 30 days, \(\mathrm{s}_{\mathrm{C} 1}\) is the standard error of the average amount an every day smoker smokes per day, \(\mathrm{C}_{2}\) is the amount a some day smoker smokes per day averaged over 30 days and \(\mathrm{s}_{\mathrm{C} 2}\) is the standard error of the average amount a some day smoker smokes per day.
(Note: \(\mathrm{C}_{2}\) is calculated by multiplying the number of cigarettes a some day smoker smokes per day and the number of days per month a some day smoker smokes, then dividing by 30 .)

Illustration. Continuing with the above example, suppose there were \(36,711,000\) every day smokers that smoked an average of 16.65 cigarettes per day. During this same month, \(8,256,000\) some day smokers smoked
an average of 3.34 cigarettes per day. Then, the average amount smoked by current smokers is 14.21 cigarettes per day. Use formula (1) to get \(\mathrm{s}_{\mathrm{E}}{ }^{2}\) and \(\mathrm{s}_{\mathrm{P}}{ }^{2}\), and formula (6) to get \(\mathrm{s}_{\mathrm{C} 1}{ }^{2}\) and \(\mathrm{s}_{\mathrm{C} 2}{ }^{2}\). Use the appropriate parameters from Table D to get
\begin{tabular}{|c|c|}
\hline Mean & 14.21 \\
\hline Estimate, E & 36,711,000 \\
\hline Standard error of E & 304,000 \\
\hline Estimate, P & 8,256,000 \\
\hline Standard error of P & 156,000 \\
\hline Mean, C \({ }_{1}\) & 16.65 \\
\hline Standard error of \(\mathrm{C}_{1}\) & 0.11 \\
\hline Mean, \(\mathrm{C}_{2}\) & 3.34 \\
\hline Standard error of \(\mathrm{C}_{2}\) & 0.03 \\
\hline a parameter & -0.000015 \\
\hline b parameter & 3,067 \\
\hline Standard error, \({ }^{\text {S }}\) - & 0.10 \\
\hline 90\% conf. int. & 14.05 to 14.37 \\
\hline
\end{tabular}

The standard error is calculated as
\[
\begin{aligned}
s_{\bar{x}}= & {\left[\left(\frac{8,256,000(16.65-3.34)}{(36,711,000+8,256,000)^{2}}\right)^{2}(304,000)^{2}+\left(\frac{36,711,000(3.34-16.65)}{(36,711,000+8,256,000)^{2}}\right)^{2}(156,000)^{2}\right.} \\
& \left.+\left(\frac{36,711,000}{36,711,000+8,256,000}\right)^{2}(0.11)^{2}+\left(\frac{8,256,000}{36,711,000+8,256,000}\right)^{2}(0.03)^{2}\right]^{\frac{1}{2}} \\
= & 0.10
\end{aligned}
\]

The 90 percent confidence interval is calculated as \(14.21 \pm 1.645 \times 0.10\).
Note: The \(a\) and \(b\) parameters can not be used when estimating variances for complex analyses such as linear regression. Variances must be estimated using replicate weights for those types of analyses. Replicate weights can be obtained from the Census Bureau upon request.

\section*{Table C. Standard Error Parameters}

\section*{Parameters for Computation of Standard Errors \\ for Labor Force Characteristics - September 1998 and January and May 1999}

Characteristic
Labor Force and Not in Labor
Force Data other than Agricultural
Employment and Unemployment
\begin{tabular}{lll} 
Total \(^{1}\) & -0.000018 & 2,985 \\
Men \(^{1}\) & -0.000033 & 2,764 \\
Women & -0.000030 & 2,530 \\
Both Sexes, 16 to 19 years & -0.000172 & 2,545 \\
White \(^{1}\) & -0.000020 & 2,985 \\
Men & -0.000037 & 2,767 \\
Women & -0.000034 & 2,527 \\
Both Sexes, 16 to 19 years & -0.000204 & 2,550 \\
Black & -0.000125 & 3,139 \\
Men & -0.000302 & 2,931 \\
Women & -0.000183 & 2,637 \\
Both Sexes, 16 to 19 years & -0.001295 & 2,949 \\
Hispanic Origin & -0.000206 & 3,896
\end{tabular}
\(\begin{array}{lll}\text { Not in Labor Force (use only for } & & \\ \text { Total, Total Men, and White) } & +0.000006 & 829\end{array}\)
Agricultural Employment
Total or White
Men
Women
Both Sexes, 16 to 19 years
Black
Hispanic Origin
Men
Both Sexes, 16 to 19 years

Unemployment
Total or White
Black
Hispanic Origin
For not in labor force characteristics, use the Not in Labor Force parameters
NOTES: These parameters are to be applied to basic CPS monthly labor force estimates.
Use the age 16-19 category for all breakdowns comprised solely of 16-19 year olds or any subsets of that group.

For foreign-born characteristics for Total and White, the a and b parameters should be multiplied by 1.3. No adjustment is necessary for foreign-born characteristics for Blacks and Hispanics.

Table D. Standard Error Parameters
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multicolumn{7}{|l|}{Standard Error Parameters for Tobacco Use: People 1992-2000} \\
\hline \multirow[t]{2}{*}{Type of Characteristic} & \multicolumn{2}{|l|}{Total or White} & \multicolumn{2}{|l|}{Black or Other} & \multicolumn{2}{|l|}{Hispanic} \\
\hline & a & b & a & b & a & b \\
\hline \multicolumn{7}{|l|}{ONE MONTH} \\

Note: The parameters above are for data using the nonresponse weights. For data using the self-response weights, multiply a and b parameters by 1.23 .
\({ }^{1}\) 1998-2000 refers to combining two or three months of data for 1998-1999 for most items on the Tobacco Use Supplements and combining two or three months of data for 1998 and 2000 (in the future) for "other tobacco products usage" using the new questions in 1998 and 2000.
